# The transverse index problem for Riemannian foliations

Introduction

Riemannian foliations

Basic index

Compact Lie group actions

Riemannian groupoids

Index theorem

Steps of the proof

Joint work with Alexander Gorokhovsky

# Foliation index theory

Let  $(M, \mathcal{F})$  be a compact foliated manifold.

# Foliation index theory

Let  $(M, \mathcal{F})$  be a compact foliated manifold.

There are two types of foliated index theories,

1. Longitudinal index theory, and
2. Transverse index theory.

# What I won't be talking about

Longitudinal index theorem (Connes-Skandalis)

# What I won't be talking about

Longitudinal index theorem (Connes-Skandalis)

Suppose that there is a differential operator  $D$  on  $M$  that is Dirac-type, except that it only differentiates in the leaf directions.

# What I won't be talking about

Longitudinal index theorem (Connes-Skandalis)

Suppose that there is a differential operator  $D$  on  $M$  that is Dirac-type, except that it only differentiates in the leaf directions.

We can think  $D$  as a “family” of leaf-wise operators, parametrized by the “leaf space” of the foliation.

# What I won't be talking about

Longitudinal index theorem (Connes-Skandalis)

Suppose that there is a differential operator  $D$  on  $M$  that is Dirac-type, except that it only differentiates in the leaf directions.

We can think  $D$  as a “family” of leaf-wise operators, parametrized by the “leaf space” of the foliation.

One can define its “families index” in the “K-theory of the leaf space of the foliation”.

# What I won't be talking about

Longitudinal index theorem (Connes-Skandalis)

Suppose that there is a differential operator  $D$  on  $M$  that is Dirac-type, except that it only differentiates in the leaf directions.

We can think  $D$  as a “family” of leaf-wise operators, parametrized by the “leaf space” of the foliation.

One can define its “families index” in the “K-theory of the leaf space of the foliation”.

More precisely,  $\text{Index}(D) \in K_*(C_r^*(M; \mathcal{F}))$ , where  $C_r^*(M; \mathcal{F})$  is the reduced  $C^*$ -algebra of the foliation.

# What I won't be talking about

Longitudinal index theorem (Connes-Skandalis)

Suppose that there is a differential operator  $D$  on  $M$  that is Dirac-type, except that it only differentiates in the leaf directions.

We can think  $D$  as a “family” of leaf-wise operators, parametrized by the “leaf space” of the foliation.

One can define its “families index” in the “K-theory of the leaf space of the foliation”.

More precisely,  $\text{Index}(D) \in K_*(C_r^*(M; \mathcal{F}))$ , where  $C_r^*(M; \mathcal{F})$  is the reduced  $C^*$ -algebra of the foliation.

The longitudinal index theorem gives a topological equivalent of  $\text{Index}(D)$ .

# Transverse index problem

Suppose instead that  $D$  is a Dirac-type operator, except that it only differentiates in the **transverse** direction to the foliation, and it's invariant under sliding along leaves.

# Transverse index problem

Suppose instead that  $D$  is a Dirac-type operator, except that it only differentiates in the **transverse** direction to the foliation, and it's invariant under sliding along leaves.

Then  $D$  is like an operator **on** the leaf space.

# Transverse index problem

Suppose instead that  $D$  is a Dirac-type operator, except that it only differentiates in the **transverse** direction to the foliation, and it's invariant under sliding along leaves.

Then  $D$  is like an operator **on** the leaf space.

To make sense of  $D$ , we must assume that  $(M, \mathcal{F})$  has a transverse Riemannian metric.

# Transverse index problem

Suppose instead that  $D$  is a Dirac-type operator, except that it only differentiates in the **transverse** direction to the foliation, and it's invariant under sliding along leaves.

Then  $D$  is like an operator **on** the leaf space.

To make sense of  $D$ , we must assume that  $(M, \mathcal{F})$  has a transverse Riemannian metric.

**Fact :** (El-Kacimi, Glazebrook-Kamber)  $D$  is Fredholm.

# Transverse index problem

Suppose instead that  $D$  is a Dirac-type operator, except that it only differentiates in the **transverse** direction to the foliation, and it's invariant under sliding along leaves.

Then  $D$  is like an operator **on** the leaf space.

To make sense of  $D$ , we must assume that  $(M, \mathcal{F})$  has a transverse Riemannian metric.

**Fact :** (El-Kacimi, Glazebrook-Kamber)  $D$  is Fredholm.

Hence  $\text{Index}(D) \in \mathbb{Z}$  is well-defined.

# Transverse index problem

Suppose instead that  $D$  is a Dirac-type operator, except that it only differentiates in the **transverse** direction to the foliation, and it's invariant under sliding along leaves.

Then  $D$  is like an operator **on** the leaf space.

To make sense of  $D$ , we must assume that  $(M, \mathcal{F})$  has a transverse Riemannian metric.

**Fact :** (El-Kacimi, Glazebrook-Kamber)  $D$  is Fredholm.

Hence  $\text{Index}(D) \in \mathbb{Z}$  is well-defined.

**What is it?**

# Transverse index problem

$\text{Index}(D) \in \mathbb{Z}$ . We want a local formula for it.

# Transverse index problem

$\text{Index}(D) \in \mathbb{Z}$ . We want a local formula for it.

**Prototypical example** : the Atiyah-Singer index theorem.

# Transverse index problem

$\text{Index}(D) \in \mathbb{Z}$ . We want a local formula for it.

**Prototypical example** : the Atiyah-Singer index theorem.

Suppose that  $M$  is foliated by points.

# Transverse index problem

$\text{Index}(D) \in \mathbb{Z}$ . We want a local formula for it.

**Prototypical example** : the Atiyah-Singer index theorem.

Suppose that  $M$  is foliated by points. Then  $D$  is just a Dirac-type operator on  $M$ , and

$$\text{Index}(D) = \int_M \hat{A}(TM) \text{ch}(E).$$

# Transverse index problem

$\text{Index}(D) \in \mathbb{Z}$ . We want a local formula for it.

**Prototypical example** : the Atiyah-Singer index theorem.

Suppose that  $M$  is foliated by points. Then  $D$  is just a Dirac-type operator on  $M$ , and

$$\text{Index}(D) = \int_M \widehat{A}(TM) \text{ch}(E).$$

In general, we would like a formula for  $\text{Index}(D)$  in terms of the local geometry of the foliated manifold.

## Another known case

Suppose that the leaves of  $(M, \mathcal{F})$  are all compact.

## Another known case

Suppose that the leaves of  $(M, \mathcal{F})$  are all compact.

Then the leaf space of  $(M, \mathcal{F})$  is an orbifold. The operator  $D$  becomes an orbifold Dirac-type operator.

## Another known case

Suppose that the leaves of  $(M, \mathcal{F})$  are all compact.

Then the leaf space of  $(M, \mathcal{F})$  is an orbifold. The operator  $D$  becomes an orbifold Dirac-type operator.

Orbifold index theorem (Kawasaki 1981) :

$$\text{Index}(D) = \sum_i \int_{\Sigma_i} \frac{1}{m_i} \widehat{A}(T\Sigma_i) \mathcal{N}_i,$$

## Another known case

Suppose that the leaves of  $(M, \mathcal{F})$  are all compact.

Then the leaf space of  $(M, \mathcal{F})$  is an orbifold. The operator  $D$  becomes an orbifold Dirac-type operator.

Orbifold index theorem (Kawasaki 1981) :

$$\text{Index}(D) = \sum_i \int_{\Sigma_i} \frac{1}{m_i} \widehat{A}(T\Sigma_i) \mathcal{N}_i,$$

where

1.  $\{\Sigma_i\}$  are the strata of the orbifold,
2.  $m_i$  is the multiplicity of  $\Sigma_i$  and
3. The characteristic class  $\mathcal{N}_i$  is computed from the normal data of  $\Sigma_i$  and the auxiliary vector bundle  $E$ .

# Why is this problem interesting?

# Why is this problem interesting?

1. It has been open for twenty years.

# Why is this problem interesting?

1. It has been open for twenty years.
2. It leads to questions about analysis on Riemannian groupoids.

# Why is this problem interesting?

1. It has been open for twenty years.
2. It leads to questions about analysis on Riemannian groupoids.
3. Usual local index theory methods (McKean-Singer technique) don't work.

## Theorem

*Let  $M$  be a compact connected manifold equipped with a Riemannian foliation  $\mathcal{F}$ .*

## Theorem

*Let  $M$  be a compact connected manifold equipped with a Riemannian foliation  $\mathcal{F}$ . Suppose that the Molino Lie algebra is abelian and the isotropy groups are connected.*

## Theorem

*Let  $M$  be a compact connected manifold equipped with a Riemannian foliation  $\mathcal{F}$ . Suppose that the Molino Lie algebra is abelian and the isotropy groups are connected. Let  $\mathcal{E}$  be a holonomy-invariant  $\mathbb{Z}_2$ -graded normal Clifford module on  $M$ .*

## Theorem

*Let  $M$  be a compact connected manifold equipped with a Riemannian foliation  $\mathcal{F}$ . Suppose that the Molino Lie algebra is abelian and the isotropy groups are connected. Let  $\mathcal{E}$  be a holonomy-invariant  $\mathbb{Z}_2$ -graded normal Clifford module on  $M$ . Let  $D$  be the basic Dirac-type operator acting on holonomy-invariant sections of  $\mathcal{E}$ .*

## Theorem

*Let  $M$  be a compact connected manifold equipped with a Riemannian foliation  $\mathcal{F}$ . Suppose that the Molino Lie algebra is abelian and the isotropy groups are connected. Let  $\mathcal{E}$  be a holonomy-invariant  $\mathbb{Z}_2$ -graded normal Clifford module on  $M$ . Let  $D$  be the basic Dirac-type operator acting on holonomy-invariant sections of  $\mathcal{E}$ . Then*

$$\text{Index}(D) = \int_{W_{\max}} \widehat{A}(TW_{\max}) \mathcal{N}_{\mathcal{E}}.$$

## Theorem

*Let  $M$  be a compact connected manifold equipped with a Riemannian foliation  $\mathcal{F}$ . Suppose that the Molino Lie algebra is abelian and the isotropy groups are connected. Let  $\mathcal{E}$  be a holonomy-invariant  $\mathbb{Z}_2$ -graded normal Clifford module on  $M$ . Let  $D$  be the basic Dirac-type operator acting on holonomy-invariant sections of  $\mathcal{E}$ . Then*

$$\text{Index}(D) = \int_{W_{\max}} \widehat{A}(TW_{\max}) \mathcal{N}_{\mathcal{E}}.$$

*Here*

- ▶  $W_{\max}$  is the deepest stratum in the space of leaf closures.

## Theorem

*Let  $M$  be a compact connected manifold equipped with a Riemannian foliation  $\mathcal{F}$ . Suppose that the Molino Lie algebra is abelian and the isotropy groups are connected. Let  $\mathcal{E}$  be a holonomy-invariant  $\mathbb{Z}_2$ -graded normal Clifford module on  $M$ . Let  $D$  be the basic Dirac-type operator acting on holonomy-invariant sections of  $\mathcal{E}$ . Then*

$$\text{Index}(D) = \int_{W_{\max}} \widehat{A}(TW_{\max}) \mathcal{N}_{\mathcal{E}}.$$

*Here*

- ▶  $W_{\max}$  is the deepest stratum in the space of leaf closures.
- ▶  $\mathcal{N}_{\mathcal{E}}$  is a “renormalized” characteristic class, which is computed from the normal data of  $W_{\max}$ , along with  $\mathcal{E}$ .

Under the hypotheses of the preceding theorem,

Under the hypotheses of the preceding theorem,

1. The basic Euler characteristic of  $(M, \mathcal{F})$  equals the Euler characteristic of  $W_{\max}$ .

Under the hypotheses of the preceding theorem,

1. The basic Euler characteristic of  $(M, \mathcal{F})$  equals the Euler characteristic of  $W_{\max}$ .
2. If  $\mathcal{F}$  is transversely oriented then the basic signature of  $(M, \mathcal{F})$  equals the signature of  $W_{\max}$ .

Under the hypotheses of the preceding theorem,

1. The basic Euler characteristic of  $(M, \mathcal{F})$  equals the Euler characteristic of  $W_{\max}$ .
2. If  $\mathcal{F}$  is transversely oriented then the basic signature of  $(M, \mathcal{F})$  equals the signature of  $W_{\max}$ .
3. If  $\mathcal{F}$  has a transverse spin structure,  $D$  is the basic Dirac operator and the leaves are noncompact then  $\text{Index}(D) = 0$ .

# The transverse index problem for Riemannian foliations

Introduction

**Riemannian foliations**

Basic index

Compact Lie group actions

Riemannian groupoids

Index theorem

Steps of the proof

# What is a foliation?

# What is a foliation?

A  $k$ -dimensional foliation of a manifold  $M$  is a covering of  $M$  by foliation charts

$$\phi_j : U_j \rightarrow \mathbb{R}^k \times \mathbb{R}^{n-k}$$

# What is a foliation?

A  $k$ -dimensional foliation of a manifold  $M$  is a covering of  $M$  by foliation charts

$$\phi_j : U_j \rightarrow \mathbb{R}^k \times \mathbb{R}^{n-k}$$

whose transition maps are of the form

$$\phi_{ij}(x, y) = (g_{ij}(x, y), h_{ij}(y)).$$

# What is a Riemannian foliation?

# What is a Riemannian foliation?

If  $(M, \mathcal{F})$  is a foliation, its normal bundle is

$$N\mathcal{F} = TM/T\mathcal{F}.$$

# What is a Riemannian foliation?

If  $(M, \mathcal{F})$  is a foliation, its normal bundle is

$$N\mathcal{F} = TM/T\mathcal{F}.$$

A **Riemannian foliation** is a foliation  $(M, \mathcal{F})$  along with an inner product on  $N\mathcal{F}$  that locally pulls back, under the submersion  $U \rightarrow \mathbb{R}^{n-k}$ , from a Riemannian metric on  $\mathbb{R}^{n-k}$ .

# What is a Riemannian foliation?

If  $(M, \mathcal{F})$  is a foliation, its normal bundle is

$$N\mathcal{F} = TM/T\mathcal{F}.$$

A **Riemannian foliation** is a foliation  $(M, \mathcal{F})$  along with an inner product on  $N\mathcal{F}$  that locally pulls back, under the submersion  $U \rightarrow \mathbb{R}^{n-k}$ , from a Riemannian metric on  $\mathbb{R}^{n-k}$ .

# Complete transversal

A **complete transversal**  $\mathcal{T}$  is a (possibly disconnected) submanifold, with  $\dim(\mathcal{T}) = \text{codim}(\mathcal{F})$ , that is transverse to  $\mathcal{F}$  and hits every leaf of  $(M, \mathcal{F})$ . It always exists.

# Complete transversal

A **complete transversal**  $\mathcal{T}$  is a (possibly disconnected) submanifold, with  $\dim(\mathcal{T}) = \text{codim}(\mathcal{F})$ , that is transverse to  $\mathcal{F}$  and hits every leaf of  $(M, \mathcal{F})$ . It always exists.

$\mathcal{T}$  acquires a Riemannian metric, pulled back from the local diffeomorphisms  $\mathcal{T} \cap U \rightarrow \mathbb{R}^{n-k}$ .

# Holonomy

Start at a point  $p \in \mathcal{T}$ . Slide along a path in the leaf through  $p$ , until you hit a point  $q \in \mathcal{T}$ . This gives a germ of a diffeomorphism sending  $p \in \mathcal{T}$  to  $q \in \mathcal{T}$ , the **holonomy element**.

# Holonomy

Start at a point  $p \in \mathcal{T}$ . Slide along a path in the leaf through  $p$ , until you hit a point  $q \in \mathcal{T}$ . This gives a germ of a diffeomorphism sending  $p \in \mathcal{T}$  to  $q \in \mathcal{T}$ , the **holonomy element**.

“Basic” means holonomy-invariant on  $\mathcal{T}$ . For example, a Riemannian foliation has a basic Riemannian metric.

# The transverse index problem for Riemannian foliations

Introduction

Riemannian foliations

**Basic index**

Compact Lie group actions

Riemannian groupoids

Index theorem

Steps of the proof

If  $(M, \mathcal{F})$  is a Riemannian foliation, it makes sense to talk about a basic  $\mathbb{Z}_2$ -graded Clifford module  $\mathcal{E}$  on  $\mathcal{T}$  and a basic Dirac-type operator  $D$ , acting on the basic sections of  $\mathcal{E}$ .

# Basic operators

If  $(M, \mathcal{F})$  is a Riemannian foliation, it makes sense to talk about a basic  $\mathbb{Z}_2$ -graded Clifford module  $\mathcal{E}$  on  $\mathcal{T}$  and a basic Dirac-type operator  $D$ , acting on the basic sections of  $\mathcal{E}$ .

$$\text{Index}(D) = \dim \text{Ker}(D_+) - \dim \text{Ker}(D_-).$$

# Basic operators

If  $(M, \mathcal{F})$  is a Riemannian foliation, it makes sense to talk about a basic  $\mathbb{Z}_2$ -graded Clifford module  $\mathcal{E}$  on  $\mathcal{T}$  and a basic Dirac-type operator  $D$ , acting on the basic sections of  $\mathcal{E}$ .

$$\text{Index}(D) = \dim \text{Ker}(D_+) - \dim \text{Ker}(D_-).$$

What is it?

# One approach

Suppose (for simplicity) that  $\mathcal{T}$  has a basic spin structure. Putting  $q = \text{codim}(\mathcal{F})$ , there is a principal  $\text{Spin}(q)$ -bundle

$$F_{\text{Spin}(q)}M \rightarrow M.$$

# One approach

Suppose (for simplicity) that  $\mathcal{T}$  has a basic spin structure. Putting  $q = \text{codim}(\mathcal{F})$ , there is a principal  $\text{Spin}(q)$ -bundle

$$F_{\text{Spin}(q)}M \rightarrow M.$$

There is a lifted foliation  $\widehat{\mathcal{F}}$  of  $F_{\text{Spin}(q)}M$ , with  $\dim(\widehat{\mathcal{F}}) = \dim(\mathcal{F})$ . The closures of its leaves form the fibers of a **fiber bundle**  $F_{\text{Spin}(q)}M \rightarrow \widehat{W}$ , which is  $\text{Spin}(q)$ -equivariant.

# One approach

Suppose (for simplicity) that  $\mathcal{T}$  has a basic spin structure. Putting  $q = \text{codim}(\mathcal{F})$ , there is a principal  $\text{Spin}(q)$ -bundle

$$F_{\text{Spin}(q)}M \rightarrow M.$$

There is a lifted foliation  $\widehat{\mathcal{F}}$  of  $F_{\text{Spin}(q)}M$ , with  $\dim(\widehat{\mathcal{F}}) = \dim(\mathcal{F})$ . The closures of its leaves form the fibers of a **fiber bundle**  $F_{\text{Spin}(q)}M \rightarrow \widehat{W}$ , which is  $\text{Spin}(q)$ -equivariant.

$$\begin{array}{ccc} F_{\text{Spin}(q)}M & \rightarrow & \widehat{W} \\ \downarrow & & \downarrow \\ M & \rightarrow & W \end{array}$$

# One approach

Suppose (for simplicity) that  $\mathcal{T}$  has a basic spin structure. Putting  $q = \text{codim}(\mathcal{F})$ , there is a principal  $\text{Spin}(q)$ -bundle

$$F_{\text{Spin}(q)}M \rightarrow M.$$

There is a lifted foliation  $\widehat{\mathcal{F}}$  of  $F_{\text{Spin}(q)}M$ , with  $\dim(\widehat{\mathcal{F}}) = \dim(\mathcal{F})$ . The closures of its leaves form the fibers of a **fiber bundle**  $F_{\text{Spin}(q)}M \rightarrow \widehat{W}$ , which is  $\text{Spin}(q)$ -equivariant.

$$\begin{array}{ccc} F_{\text{Spin}(q)}M & \rightarrow & \widehat{W} \\ \downarrow & & \downarrow \\ M & \rightarrow & W \end{array}$$

One can lift  $D$  to an operator on  $F_{\text{Spin}(q)}M$ ,

# One approach

Suppose (for simplicity) that  $\mathcal{T}$  has a basic spin structure. Putting  $q = \text{codim}(\mathcal{F})$ , there is a principal  $\text{Spin}(q)$ -bundle

$$F_{\text{Spin}(q)}M \rightarrow M.$$

There is a lifted foliation  $\widehat{\mathcal{F}}$  of  $F_{\text{Spin}(q)}M$ , with  $\dim(\widehat{\mathcal{F}}) = \dim(\mathcal{F})$ . The closures of its leaves form the fibers of a **fiber bundle**  $F_{\text{Spin}(q)}M \rightarrow \widehat{W}$ , which is  $\text{Spin}(q)$ -equivariant.

$$\begin{array}{ccc} F_{\text{Spin}(q)}M & \rightarrow & \widehat{W} \\ \downarrow & & \downarrow \\ M & \rightarrow & W \end{array}$$

One can lift  $D$  to an operator on  $F_{\text{Spin}(q)}M$ , which then descends to a  $\text{Spin}(q)$ -transversally elliptic operator  $\widehat{D}$  on  $\widehat{W}$ .

# One approach

Index theorem for an operator which is transversally elliptic with respect to a compact Lie group action (Atiyah, Berline-Vergne, Vergne, Paradan, ...)

# One approach

Index theorem for an operator which is transversally elliptic with respect to a compact Lie group action (Atiyah, Berline-Vergne, Vergne, Paradan, . . .)

Does not seem to be explicit enough (so far) to compute  $\text{Index}(D)$ .

# One approach

Index theorem for an operator which is transversally elliptic with respect to a compact Lie group action (Atiyah, Berline-Vergne, Vergne, Paradan, ...)

Does not seem to be explicit enough (so far) to compute  $\text{Index}(D)$ .

Approach of Brüning-Kamber-Richardson : do equivariant modifications of  $\widehat{W}$  to simplify the isotropy group structure. Keep track of how the index changes under the modifications. Get a semilocal formula for  $\text{Index}(D)$ .

**Problem** :  $\int_{T^k} \mathcal{L}(g, z) d\mu_{T^k}(g)$  generally diverges!

# Index computation

Suppose that  $G = T^k$ .

$$\begin{aligned}\text{Index}(D_{\text{inv}}) &= \int_{T^k} \text{Index}(g) d\mu_{T^k}(g) \\ &= \int_{T^k} \left( \int_{Z^g} \mathcal{L}(g) \right) d\mu_{T^k}(g) \\ &= \int_{T^k} \left( \int_{Z^{T^k}} \mathcal{L}(g, z) dz \right) d\mu_{T^k}(g) \\ &\stackrel{?}{=} \int_{Z^{T^k}} \left( \int_{T^k} \mathcal{L}(g, z) d\mu_{T^k}(g) \right) dz\end{aligned}$$

**Problem** :  $\int_{T^k} \mathcal{L}(g, z) d\mu_{T^k}(g)$  generally diverges!

Get cancellations from various components of  $Z^{T^k}$ .

$$\int_{T^k} \left( \int_{Z^{T^k}} \mathcal{L}(g, z) dz \right) d\mu_{T^k}(g) \stackrel{?}{=} \int_{Z^{T^k}} \left( \int_{T^k} \mathcal{L}(g, z) d\mu_{T^k}(g) \right) dz$$

$$\int_{T^k} \left( \int_{Z^{T^k}} \mathcal{L}(g, z) dz \right) d\mu_{T^k}(g) \stackrel{?}{=} \int_{Z^{T^k}} \left( \int_{T^k} \mathcal{L}(g, z) d\mu_{T^k}(g) \right) dz$$

McKean-Singer-type localization, to compute  $\text{Index}(D_{\text{inv}})$ , doesn't work.

$$\int_{T^k} \left( \int_{Z^{T^k}} \mathcal{L}(g, z) dz \right) d\mu_{T^k}(g) \stackrel{?}{=} \int_{Z^{T^k}} \left( \int_{T^k} \mathcal{L}(g, z) d\mu_{T^k}(g) \right) dz$$

McKean-Singer-type localization, to compute  $\text{Index}(D_{\text{inv}})$ , doesn't work.

In this case, we can subtract off the divergent terms of  $\int_{T^k} \mathcal{L}(g, z) d\mu_{T^k}(g)$  by hand. We know that they will cancel out in the end.

$$\int_{T^k} \left( \int_{Z^{T^k}} \mathcal{L}(g, z) dz \right) d\mu_{T^k}(g) \stackrel{?}{=} \int_{Z^{T^k}} \left( \int_{T^k} \mathcal{L}(g, z) d\mu_{T^k}(g) \right) dz$$

McKean-Singer-type localization, to compute  $\text{Index}(D_{\text{inv}})$ , doesn't work.

In this case, we can subtract off the divergent terms of  $\int_{T^k} \mathcal{L}(g, z) d\mu_{T^k}(g)$  by hand. We know that they will cancel out in the end.

But what to do for more general Riemannian foliations, which may not reduce to compact Lie group actions?

# A way out

A Riemannian foliation may not come from a Lie group action, but there is always a local action by a **Lie algebra**  $\mathfrak{g}$ .

# A way out

A Riemannian foliation may not come from a Lie group action, but there is always a local action by a **Lie algebra**  $\mathfrak{g}$ .

Idea : prove a Kirillov-type delocalized index formula, in terms of  $X \in \mathfrak{g}$ .

# A way out

A Riemannian foliation may not come from a Lie group action, but there is always a local action by a **Lie algebra**  $\mathfrak{g}$ .

Idea : prove a Kirillov-type delocalized index formula, in terms of  $X \in \mathfrak{g}$ .

If  $\mathfrak{g}$  is abelian, we can replace the nonexistent “integral over  $G$ ” by an averaging over  $X \in \mathfrak{g}$ .

# The transverse index problem for Riemannian foliations

Introduction

Riemannian foliations

Basic index

Compact Lie group actions

**Riemannian groupoids**

Index theorem

Steps of the proof

# Groupoid

Let  $\mathcal{T}$  be a complete transversal for the Riemannian foliation  $(M, \mathcal{F})$ .

The **Lie algebroid** of  $\overline{\mathcal{G}}$  is a locally constant sheaf of Lie algebras.

The **Lie algebroid** of  $\overline{\mathcal{G}}$  is a locally constant sheaf of Lie algebras.

Its stalk  $\mathfrak{g}$  could be **any** finite-dimensional Lie algebra.

The **Lie algebroid** of  $\overline{\mathcal{G}}$  is a locally constant sheaf of Lie algebras.

Its stalk  $\mathfrak{g}$  could be **any** finite-dimensional Lie algebra.

Local representation of  $\mathfrak{g}$  by Killing vector fields on  $\mathcal{T}$ .

The **Lie algebroid** of  $\overline{\mathcal{G}}$  is a locally constant sheaf of Lie algebras.

Its stalk  $\mathfrak{g}$  could be **any** finite-dimensional Lie algebra.

Local representation of  $\mathfrak{g}$  by Killing vector fields on  $\mathcal{T}$ .

Parallel to Cheeger-Fukaya-Gromov theory of Nil-structures in bounded curvature collapse.

The **Lie algebroid** of  $\overline{\mathcal{G}}$  is a locally constant sheaf of Lie algebras.

Its stalk  $\mathfrak{g}$  could be **any** finite-dimensional Lie algebra.

Local representation of  $\mathfrak{g}$  by Killing vector fields on  $\mathcal{T}$ .

Parallel to Cheeger-Fukaya-Gromov theory of Nil-structures in bounded curvature collapse.

Local structure of a Riemannian groupoid (Haefliger, Molino).

$\overline{\mathcal{G}}$  is a **proper** Lie groupoid, so we can integrate over it.

$\overline{\mathcal{G}}$  is a **proper** Lie groupoid, so we can integrate over it.

Let  $\{d\mu^p\}_{p \in \mathcal{T}}$  be a Haar system for  $\overline{\mathcal{G}}$ , with  $\mu^p$  a measure on  $\mathcal{G}^p$ .

$\overline{\mathcal{G}}$  is a **proper** Lie groupoid, so we can integrate over it.

Let  $\{d\mu^p\}_{p \in \mathcal{T}}$  be a Haar system for  $\overline{\mathcal{G}}$ , with  $\mu^p$  a measure on  $\mathcal{G}^p$ .

Let  $\phi \in C_c^\infty(\mathcal{T})$  be a cutoff function so that

$$\int_{\overline{\mathcal{G}}^p} \phi^2(s(g)) d\mu^p(g) = 1.$$

# Invariant subspace

Let  $\mathcal{E}$  be a  $\mathcal{G}$ -equivariant vector bundle on  $\mathcal{T}$ .

# Invariant subspace

Let  $\mathcal{E}$  be a  $\mathcal{G}$ -equivariant vector bundle on  $\mathcal{T}$ .

Define an injection  $\alpha : L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}} \rightarrow L^2(\mathcal{T}; \mathcal{E})$  by

$$\alpha(\xi) = \phi\xi,$$

# Invariant subspace

Let  $\mathcal{E}$  be a  $\mathcal{G}$ -equivariant vector bundle on  $\mathcal{T}$ .

Define an injection  $\alpha : L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}} \rightarrow L^2(\mathcal{T}; \mathcal{E})$  by

$$\alpha(\xi) = \phi\xi,$$

and a surjection  $\beta : L^2(\mathcal{T}; \mathcal{E}) \rightarrow L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}}$  by

$$(\beta(\eta))_p = \int_{\overline{\mathcal{G}}^p} \left( \eta_{s(g)} \cdot g^{-1} \right) \phi(s(g)) d\mu^p(g).$$

# Invariant subspace

Let  $\mathcal{E}$  be a  $\mathcal{G}$ -equivariant vector bundle on  $\mathcal{T}$ .

Define an injection  $\alpha : L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}} \rightarrow L^2(\mathcal{T}; \mathcal{E})$  by

$$\alpha(\xi) = \phi\xi,$$

and a surjection  $\beta : L^2(\mathcal{T}; \mathcal{E}) \rightarrow L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}}$  by

$$(\beta(\eta))_p = \int_{\overline{\mathcal{G}}^p} \left( \eta_{s(g)} \cdot g^{-1} \right) \phi(s(g)) d\mu^p(g).$$

Then

▶  $\beta \circ \alpha = \text{Id}$

# Invariant subspace

Let  $\mathcal{E}$  be a  $\mathcal{G}$ -equivariant vector bundle on  $\mathcal{T}$ .

Define an injection  $\alpha : L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}} \rightarrow L^2(\mathcal{T}; \mathcal{E})$  by

$$\alpha(\xi) = \phi\xi,$$

and a surjection  $\beta : L^2(\mathcal{T}; \mathcal{E}) \rightarrow L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}}$  by

$$(\beta(\eta))_p = \int_{\overline{\mathcal{G}}^p} \left( \eta_{s(g)} \cdot g^{-1} \right) \phi(s(g)) d\mu^p(g).$$

Then

- ▶  $\beta \circ \alpha = \text{Id}$
- ▶  $\beta = \alpha^*$

# Invariant subspace

Let  $\mathcal{E}$  be a  $\mathcal{G}$ -equivariant vector bundle on  $\mathcal{T}$ .

Define an injection  $\alpha : L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}} \rightarrow L^2(\mathcal{T}; \mathcal{E})$  by

$$\alpha(\xi) = \phi\xi,$$

and a surjection  $\beta : L^2(\mathcal{T}; \mathcal{E}) \rightarrow L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}}$  by

$$(\beta(\eta))_p = \int_{\overline{\mathcal{G}}^p} \left( \eta_{s(g)} \cdot g^{-1} \right) \phi(s(g)) d\mu^p(g).$$

Then

- ▶  $\beta \circ \alpha = \text{Id}$
- ▶  $\beta = \alpha^*$

Hence  $P = \alpha \circ \beta$  is an orthogonal projection on  $L^2(\mathcal{T}; \mathcal{E})$ , with image isomorphic to  $L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}}$ . Get inner product on  $L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}}$ .

# Spectral triple

Let  $D_0$  be a  $\mathcal{G}$ -invariant Dirac-type operator on  $L^2(\mathcal{T}; \mathcal{E})$ . (Give it APS boundary conditions).

# Spectral triple

Let  $D_0$  be a  $\mathcal{G}$ -invariant Dirac-type operator on  $L^2(\mathcal{T}; \mathcal{E})$ . (Give it APS boundary conditions).

## Proposition

$(C_c^\infty(\overline{\mathcal{G}}), L^2(\mathcal{T}; \mathcal{E}), D_0)$  is a spectral triple of dimension  $q$ .

# Spectral triple

Let  $D_0$  be a  $\mathcal{G}$ -invariant Dirac-type operator on  $L^2(\mathcal{T}; \mathcal{E})$ . (Give it APS boundary conditions).

## Proposition

$(C_c^\infty(\overline{\mathcal{G}}), L^2(\mathcal{T}; \mathcal{E}), D_0)$  is a spectral triple of dimension  $q$ .

Put  $D_{\text{inv}} = \beta \circ D_0 \circ \alpha$ , an operator on  $L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}}$ . It is unitarily equivalent to  $P \circ D_0 \circ P$  on  $\text{Im}(P)$ .

# Spectral triple

Let  $D_0$  be a  $\mathcal{G}$ -invariant Dirac-type operator on  $L^2(\mathcal{T}; \mathcal{E})$ . (Give it APS boundary conditions).

## Proposition

$(C_c^\infty(\overline{\mathcal{G}}), L^2(\mathcal{T}; \mathcal{E}), D_0)$  is a spectral triple of dimension  $q$ .

Put  $D_{\text{inv}} = \beta \circ D_0 \circ \alpha$ , an operator on  $L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}}$ . It is unitarily equivalent to  $P \circ D_0 \circ P$  on  $\text{Im}(P)$ . One finds

$$D_{\text{inv}} = D_0 - \frac{1}{2}c(\tau),$$

where  $\tau$  is a certain closed  $\mathcal{G}$ -invariant 1-form on  $\mathcal{T}$ .

# Spectral triple

Let  $D_0$  be a  $\mathcal{G}$ -invariant Dirac-type operator on  $L^2(\mathcal{T}; \mathcal{E})$ . (Give it APS boundary conditions).

## Proposition

$(C_c^\infty(\overline{\mathcal{G}}), L^2(\mathcal{T}; \mathcal{E}), D_0)$  is a spectral triple of dimension  $q$ .

Put  $D_{\text{inv}} = \beta \circ D_0 \circ \alpha$ , an operator on  $L^2(\mathcal{T}; \mathcal{E})^{\overline{\mathcal{G}}}$ . It is unitarily equivalent to  $P \circ D_0 \circ P$  on  $\text{Im}(P)$ . One finds

$$D_{\text{inv}} = D_0 - \frac{1}{2}c(\tau),$$

where  $\tau$  is a certain closed  $\mathcal{G}$ -invariant 1-form on  $\mathcal{T}$ .

## Corollary

$D_{\text{inv}}$  is Fredholm. In fact,  $e^{-tD_{\text{inv}}^2}$  is trace-class for all  $t > 0$ .

Let  $D_\alpha$  be the Dirac-type operator on  $Y_\alpha$ . Let  $D_{\text{inv},\alpha}$  be its restriction to  $T^{k_\alpha}$ -invariant sections.

Put

$$\begin{aligned} Q_{\text{inv},\alpha} &= \frac{I - e^{-tD_{\text{inv},\alpha}^2}}{D_{\text{inv},\alpha}^2} D_{\text{inv},\alpha} \\ &= \int_0^t e^{-sD_{\text{inv},\alpha}^2} D_{\text{inv},\alpha} ds. \end{aligned}$$

## Proposition

$\sum_{\alpha} \rho_{\alpha} \mathbf{Q}_{\text{inv},\alpha} \eta_{\alpha}$  *is a parametrix for  $D_{\text{inv}}$ .*

## Proposition

$\sum_{\alpha} \rho_{\alpha} Q_{\text{inv},\alpha} \eta_{\alpha}$  is a parametrix for  $D_{\text{inv}}$ .

Also, for all  $t > 0$ ,

$$\text{Index}(D_{\text{inv}}) = \sum_{\alpha} \text{Tr}_s \left( e^{-tD_{\text{inv},\alpha}^2} \eta_{\alpha} \right) + \frac{1}{2} \sum_{\alpha} \text{Tr}_s \left( Q_{\text{inv},\alpha} [D_{\text{inv},\alpha}, \eta_{\alpha}] \right)$$

## Proposition

$\sum_{\alpha} \rho_{\alpha} Q_{\text{inv},\alpha} \eta_{\alpha}$  is a parametrix for  $D_{\text{inv}}$ .

Also, for all  $t > 0$ ,

$$\begin{aligned} \text{Index}(D_{\text{inv}}) &= \sum_{\alpha} \text{Tr}_s \left( e^{-tD_{\text{inv},\alpha}^2} \eta_{\alpha} \right) + \frac{1}{2} \sum_{\alpha} \text{Tr}_s \left( Q_{\text{inv},\alpha} [D_{\text{inv},\alpha}, \eta_{\alpha}] \right) \\ &= \sum_{\alpha} \text{Tr}_s \left( e^{-tD_{\text{inv},\alpha}^2} \eta_{\alpha} \right) + \frac{1}{2} \sum_{\alpha, \beta} \text{Tr}_s \left( \rho_{\alpha} (Q_{\text{inv},\alpha} - Q_{\text{inv},\beta}) \eta_{\beta} [D_{\text{inv},\alpha}, \eta_{\alpha}] \right) \end{aligned}$$

## Step 2

Fix a Haar measure  $d\mu_{\mathfrak{g}}$  on  $\mathfrak{g} \simeq \mathbb{R}^k$ . If  $F \in C^\infty(\mathbb{R}^k)$  is a finite sum of periodic functions, put

$$AV_X F = \lim_{R \rightarrow \infty} \frac{\int_{B(0,R)} F(X) d\mu_{\mathfrak{g}}(X)}{\int_{B(0,R)} 1 d\mu_{\mathfrak{g}}(X)}.$$

## Step 2

Fix a Haar measure  $d\mu_{\mathfrak{g}}$  on  $\mathfrak{g} \simeq \mathbb{R}^k$ . If  $F \in C^\infty(\mathbb{R}^k)$  is a finite sum of periodic functions, put

$$AV_X F = \lim_{R \rightarrow \infty} \frac{\int_{B(0,R)} F(X) d\mu_{\mathfrak{g}}(X)}{\int_{B(0,R)} 1 d\mu_{\mathfrak{g}}(X)}.$$

Given  $X \in \mathbb{R}^k$ , let  $X$  denote the corresponding vector field on  $Y_\alpha$ .

## Step 2

Fix a Haar measure  $d\mu_{\mathfrak{g}}$  on  $\mathfrak{g} \simeq \mathbb{R}^k$ . If  $F \in C^\infty(\mathbb{R}^k)$  is a finite sum of periodic functions, put

$$AV_X F = \lim_{R \rightarrow \infty} \frac{\int_{B(0,R)} F(X) d\mu_{\mathfrak{g}}(X)}{\int_{B(0,R)} 1 d\mu_{\mathfrak{g}}(X)}.$$

Given  $X \in \mathbb{R}^k$ , let  $X$  denote the corresponding vector field on  $Y_\alpha$ .

### Proposition

$$\begin{aligned} \text{Index}(D_{\text{inv}}) &= AV_X \left( \sum_{\alpha} \text{Tr}_s \left( e^{-(tD_\alpha^2 + \mathcal{L}_X)} \eta_\alpha \right) \right. \\ &\quad \left. + \frac{1}{2} \sum_{\alpha} \int_0^t \text{Tr}_s \left( e^{-(sD_\alpha^2 + \mathcal{L}_X)} D_\alpha [D_\alpha, \eta_\alpha] ds \right) \right). \end{aligned}$$

## Step 3

For  $t > 0$  and  $\epsilon \in \mathbb{C}$ , put

$$D_{\alpha,t,\epsilon} = D_{\alpha} + \epsilon \frac{c(X)}{4t}.$$

## Step 3

For  $t > 0$  and  $\epsilon \in \mathbb{C}$ , put

$$D_{\alpha,t,\epsilon} = D_{\alpha} + \epsilon \frac{c(X)}{4t}.$$

Put

$$F_{t,\epsilon}(X) = \sum_{\alpha} \text{Tr}_s \left( e^{-(tD_{\alpha,t,\epsilon}^2 + \mathcal{L}_X)} \eta_{\alpha} \right) \\ + \frac{1}{2} \sum_{\alpha} \int_0^t \text{Tr}_s \left( e^{-(sD_{\alpha,t,\epsilon}^2 + \mathcal{L}_X)} D_{\alpha,t,\epsilon} [D_{\alpha,t,\epsilon}, \eta_{\alpha}] ds \right).$$

## Step 3

For  $t > 0$  and  $\epsilon \in \mathbb{C}$ , put

$$D_{\alpha,t,\epsilon} = D_{\alpha} + \epsilon \frac{c(X)}{4t}.$$

Put

$$F_{t,\epsilon}(X) = \sum_{\alpha} \text{Tr}_s \left( e^{-(tD_{\alpha,t,\epsilon}^2 + \mathcal{L}_X)} \eta_{\alpha} \right) \\ + \frac{1}{2} \sum_{\alpha} \int_0^t \text{Tr}_s \left( e^{-(sD_{\alpha,t,\epsilon}^2 + \mathcal{L}_X)} D_{\alpha,t,\epsilon} [D_{\alpha,t,\epsilon}, \eta_{\alpha}] ds \right).$$

From before,

$$\text{Index}(D_{\text{inv}}) = AV_X F_{t,0}.$$

$$D_{\alpha,t,\epsilon} = D_{\alpha} + \epsilon \frac{c(X)}{4t}.$$

$$D_{\alpha,t,\epsilon} = D_{\alpha} + \epsilon \frac{c(X)}{4t}.$$

## Proposition

$F_{t,0}(X)$  is independent of  $t$ .

$$D_{\alpha,t,\epsilon} = D_{\alpha} + \epsilon \frac{c(X)}{4t}.$$

## Proposition

$F_{t,0}(X)$  is independent of  $t$ .

## Proposition

$F_{t,\epsilon}(X)$  is independent of  $\epsilon$ .

$$D_{\alpha,t,\epsilon} = D_{\alpha} + \epsilon \frac{c(X)}{4t}.$$

## Proposition

$F_{t,0}(X)$  is independent of  $t$ .

## Proposition

$F_{t,\epsilon}(X)$  is independent of  $\epsilon$ .

## Proposition

$F_{t,2}(X)$  has a holomorphic extension to  $X \in \mathbb{C}^k$ .

# Step 4

## Proposition

If  $X \in \mathbb{R}^k$  then

$$\lim_{t \rightarrow 0} F_{t,1}(iX) = \sum_{\alpha} \int_{Y_{\alpha}} \widehat{A}(iX, Y_{\alpha}) \operatorname{ch}(iX, \mathcal{E}_{\alpha}/\mathcal{S}) \eta_{\alpha}.$$

# Step 4

## Proposition

If  $X \in \mathbb{R}^k$  then

$$\lim_{t \rightarrow 0} F_{t,1}(iX) = \sum_{\alpha} \int_{Y_{\alpha}} \widehat{A}(iX, Y_{\alpha}) \operatorname{ch}(iX, \mathcal{E}_{\alpha}/\mathcal{S}) \eta_{\alpha}.$$

## Corollary

$$\operatorname{Index}(D_{\text{inv}}) = AV_X F_{t,0} = AV_X F_{t,1}$$

# Step 4

## Proposition

If  $X \in \mathbb{R}^k$  then

$$\lim_{t \rightarrow 0} F_{t,1}(iX) = \sum_{\alpha} \int_{Y_{\alpha}} \widehat{A}(iX, Y_{\alpha}) \operatorname{ch}(iX, \mathcal{E}_{\alpha}/\mathcal{S}) \eta_{\alpha}.$$

## Corollary

$$\begin{aligned} \operatorname{Index}(D_{\text{inv}}) &= AV_X F_{t,0} = AV_X F_{t,1} \\ &= AV_X \sum_{\alpha} \int_{Y_{\alpha}} \widehat{A}(X, Y_{\alpha}) \operatorname{ch}(X, \mathcal{E}_{\alpha}/\mathcal{S}) \eta_{\alpha}. \end{aligned}$$

## Step 5

Let  $\mathcal{C} \subset \mathcal{T}$  be the elements  $p \in \mathcal{T}$  with isotropy group  $\overline{\mathcal{G}}_p^p = T^k$ .  
It passes to  $W_{\max} \subset W$ .

## Step 5

Let  $\mathcal{C} \subset \mathcal{T}$  be the elements  $p \in \mathcal{T}$  with isotropy group  $\overline{\mathcal{G}}_p^p = T^k$ .  
It passes to  $W_{\max} \subset W$ .

For simplicity, assume that each component of  $\mathcal{C}$  is spin, with normal spinor bundle  $S_N$ , and that  $\mathcal{E} = S^{\mathcal{T}} \otimes \mathcal{W}$ . Descend  $S_N$  and  $\mathcal{W}|_{\mathcal{C}}$  to  $W_{\max}$ .

## Step 5

Let  $\mathcal{C} \subset \mathcal{T}$  be the elements  $p \in \mathcal{T}$  with isotropy group  $\bar{\mathcal{G}}_p^p = T^k$ . It passes to  $W_{\max} \subset W$ .

For simplicity, assume that each component of  $\mathcal{C}$  is spin, with normal spinor bundle  $S_N$ , and that  $\mathcal{E} = S^{\mathcal{T}} \otimes \mathcal{W}$ . Descend  $S_N$  and  $\mathcal{W}|_{\mathcal{C}}$  to  $W_{\max}$ .

### Proposition

For any  $Q \in \mathbb{C}^k$ ,

$$AV_X \sum_{\alpha} \int_{Y_{\alpha}} \widehat{A}(X, Y_{\alpha}) \operatorname{ch}(X, \mathcal{E}_{\alpha}/S) \eta_{\alpha} =$$

$$AV_X \int_{W_{\max}} \widehat{A}(TW_{\max}) \frac{\operatorname{ch}_{\mathcal{W}}(e^{-X+Q})}{\operatorname{ch}_{S_N}(e^{-X+Q})}.$$

## Step 6

For generic  $Q \in \mathbb{C}^k$ , define  $\mathcal{N}_{\mathcal{E}, Q} \in \Omega^*(W_{\max})$  by

$$\mathcal{N}_{\mathcal{E}, Q} = AV_X \frac{\text{ch}_{\mathcal{W}}(e^{-X+Q})}{\text{ch}_{S_N}(e^{-X+Q})}.$$

## Step 6

For generic  $Q \in \mathbb{C}^k$ , define  $\mathcal{N}_{\mathcal{E}, Q} \in \Omega^*(W_{\max})$  by

$$\mathcal{N}_{\mathcal{E}, Q} = AV_X \frac{\text{ch}_{\mathcal{W}}(e^{-X+Q})}{\text{ch}_{S_N}(e^{-X+Q})}.$$

As long as  $\text{Im}(Q)$  remains outside certain hyperplanes in  $\mathbb{R}^k$ , what's being averaged is smooth in  $X$ .

## Step 6

For generic  $Q \in \mathbb{C}^k$ , define  $\mathcal{N}_{\varepsilon, Q} \in \Omega^*(W_{\max})$  by

$$\mathcal{N}_{\varepsilon, Q} = AV_X \frac{\text{ch}_{\mathcal{W}}(e^{-X+Q})}{\text{ch}_{S_N}(e^{-X+Q})}.$$

As long as  $\text{Im}(Q)$  remains outside certain hyperplanes in  $\mathbb{R}^k$ , what's being averaged is smooth in  $X$ .

$\mathcal{N}_{\varepsilon, Q}$  can be computed using contour integrals.

## Step 6

For generic  $Q \in \mathbb{C}^k$ , define  $\mathcal{N}_{\mathcal{E}, Q} \in \Omega^*(W_{\max})$  by

$$\mathcal{N}_{\mathcal{E}, Q} = AV_X \frac{\text{ch}_{\mathcal{W}}(e^{-X+Q})}{\text{ch}_{S_N}(e^{-X+Q})}.$$

As long as  $\text{Im}(Q)$  remains outside certain hyperplanes in  $\mathbb{R}^k$ , what's being averaged is smooth in  $X$ .

$\mathcal{N}_{\mathcal{E}, Q}$  can be computed using contour integrals.

### Corollary

$$\text{Index}(D_{\text{inv}}) = \int_{W_{\max}} \widehat{A}(TW_{\max}) \mathcal{N}_{\mathcal{E}, Q}$$
