## Worksheet 4

Sections 207 and 219 MATH 54

## January 31, 2019

**Exercise 1.** For each pair A, **b**, let T be the linear transformation given by  $T(\mathbf{x}) = A\mathbf{x}$ . For each, find a vector whose image under T is **b**. Is this vector unique?

$$A = \begin{bmatrix} 1 & 0 & -2 \\ -2 & 1 & 6 \\ 3 & -2 & -5 \end{bmatrix}, \mathbf{b} = \begin{bmatrix} -1 \\ 7 \\ -3 \end{bmatrix}, \mathbf{b} = \begin{bmatrix} 1 & -5 & -7 \\ -3 & 7 & 5 \end{bmatrix}, \mathbf{b} = \begin{bmatrix} -2 \\ -2 \end{bmatrix}$$
Another way to phrace this question is. Find an  $\mathbf{X}$  such that  $\mathbf{T}\mathbf{X} = \mathbf{b}$ .  
Is this  $\mathbf{X}$  the only solution to the matrix equation?".  
The augmented matrix of  $\mathbf{T}\mathbf{X} = \mathbf{b}$  is the augmented matrix of  $\mathbf{T}\mathbf{X} = \mathbf{b}^{\dagger}$ .  

$$\begin{bmatrix} 1 & 0 & -2 & -1 \\ -2 & 1 & 4 & -7 \\ -2 & 1 & 4 & -7 \\ -2 & 1 & 4 & -7 \\ -2 & -2 & -1 \\ -2 & 1 & 4 & -7 \\ -2 & -2 & -1 \\ -2 & 1 & 4 & -7 \\ -2 & -2 & -1 \\ -2 & -2 & -3 \\ -2 & -5 & -3 \end{bmatrix} \xrightarrow{2k_1k_2 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 5 \\ 0 & -2 & 1 & 0 \\ 0 & -2 & -1 \\ 0 & -2 & -1 \\ 0 & -2 & -1 \\ -2 & -2 & -5 \\ 0 & 0 & 5 & 10 \end{bmatrix} \xrightarrow{4k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 5 \\ 0 & 0 & 1 & 2 \end{bmatrix} \xrightarrow{2k_1k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 5 \\ 0 & 0 & 1 & 2 \end{bmatrix} \xrightarrow{2k_1k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_1k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_1k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_1k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_1k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_3k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_3k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_3k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_3k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_3k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_3k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_3k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_3k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_3k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_3k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_3k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 1 & 2 & 1 \end{bmatrix} \xrightarrow{2k_3k_3 \to 2k_3} \begin{bmatrix} 1 & 0 & -2 & -1 \\ 0 & 1 & 2 & 1 \\ 0 & 0 & 1 & 2 \end{bmatrix} \xrightarrow{2k_3k_3 \to 2k_3} \begin{bmatrix} 1 & 0 &$$

**Exercise 2.** Describe geometrically what the following linear transformation T does. It may be helpful to plot a few points and their images!

$$T = \begin{bmatrix} 0.5 & 0\\ 0 & 1 \end{bmatrix}$$

Note that 
$$T([X_1]) = \begin{bmatrix} s & 0 \\ 0 & i \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} s \\ x_2 \end{bmatrix}$$
  
So T contracts the first coordinate of a point by  $\frac{1}{2}$ ,  
and preserves the second coordinate.

Exercise 3. Let  $\mathbf{e_1} = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$ ,  $\mathbf{e_2} = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$ ,  $\mathbf{y_1} = \begin{bmatrix} 1 \\ 8 \end{bmatrix}$  and  $\mathbf{y_2} = \begin{bmatrix} -2 \\ 4 \end{bmatrix}$ . Let  $T : \mathbb{R}^2 \to \mathbb{R}^2$  be a linear transformation that maps  $\mathbf{e_1}$  to  $\mathbf{y_1}$  and  $\mathbf{e_2}$  to  $\mathbf{y_2}$ . What is the image of  $\begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$ ? We know that  $T(\lfloor t_0 \rfloor) = \begin{bmatrix} t_0 \\ 8 \end{bmatrix}$ ,  $T(\lfloor 0 \rfloor) = \begin{bmatrix} -2 \\ 4 \end{bmatrix}$ .  $f(\lfloor x_1 \rfloor) = \begin{bmatrix} t_0 \\ x_1 \end{bmatrix} = T(\lfloor x_1 \lfloor t_0 \rfloor + x_2 \lfloor t_1 \rfloor) = \begin{bmatrix} t_0 \\ 8 \end{bmatrix}$ ,  $T(\lfloor 0 \rfloor) = \begin{bmatrix} -2 \\ 4 \end{bmatrix}$ .

**Exercise 4.** Show that  $T\left(\begin{bmatrix} x_1\\ x_2 \end{bmatrix}\right) = \begin{bmatrix} x_2\\ x_1 \end{bmatrix}$  is a linear transformation.

In order to show that T is a linear transformation  
we need to show that 
$$T(a\bar{u}+b\bar{v}) = aT(\bar{u})+bT(\bar{v})$$
 for any  
 $\bar{u},\bar{v}$  in  $[\bar{k}_{1}^{2} - a_{1}b$  in  $\bar{k}_{1}a_{1}b$  in  $\bar{k}_{2}a_{1}$ .  
Let  $\bar{u} = \begin{bmatrix} x_{1} \\ x_{2} \end{bmatrix}, \quad \bar{v} = \begin{bmatrix} y_{1} \\ y_{2} \end{bmatrix}$ . Then:  
 $T(a\bar{u} + b\bar{u}) = T(a\begin{bmatrix} x_{1} \\ x_{2} \end{bmatrix} + b\begin{bmatrix} y_{1} \\ y_{3} \end{bmatrix}) = T(\begin{bmatrix} ax_{1}+by_{1} \\ ax_{2}+by_{2} \end{bmatrix}) =$   
 $\begin{bmatrix} ax_{2}+by_{2} \\ ax_{1}+bx_{1} \end{bmatrix} = a\begin{bmatrix} x_{2} \\ x_{1} \end{bmatrix} + b\begin{bmatrix} y_{2} \\ y_{1} \end{bmatrix} = aT(\begin{bmatrix} x_{1} \\ y_{2} \end{bmatrix}) + bT(\begin{bmatrix} y_{1} \\ y_{2} \end{bmatrix}) =$   
 $aT(\bar{v}) + bT(\bar{v}), \quad as desired.$   
So T is indeed a linear transformation.  
4

**Exercise 5.** Assume T is a linear transformation. Find the standard matrix of T.

- $T : \mathbb{R}^3 \to \mathbb{R}^2$ , and  $T(\mathbf{e_1}) = (1,3)$ ,  $T(\mathbf{e_2}) = (4,-7)$ ,  $T(\mathbf{e_3}) = (-4,5)$ , where  $\mathbf{e_1}$ ,  $\mathbf{e_2}$ , and  $\mathbf{e_3}$  are the columns of the  $3 \times 3$  identity matrix.
- $T: \mathbb{R}^2 \to \mathbb{R}^2$  first reflects points through the horizontal  $x_1$  axis and then reflects points through the line  $x_1 = x_2$ .
- $T : \mathbb{R}^2 \to \mathbb{R}^3$  and  $T(x_1, x_2) = (x_1 x_2, -2x_1 + x_2, x_1).$

As a group, choose one of these transformations and figure out if it is one-to-one and onto.

• Since 
$$T(\vec{e}_{1}) = (1|3|)$$
  $T(\vec{e}_{2}) = (4,7)$ ,  $T(\vec{e}_{3}) = (-4,5)$ , the standard metric  $A = \left[T(\vec{e}_{1}) \ T(\vec{e}_{2}) \ T(\vec{e}_{3})\right] = \left[\begin{matrix} 1 & 4 & -4 \\ 3 & -7 & 5\end{matrix}\right]$   
•. We first compute  $T(\vec{e}_{1})$  using the following picture:  
 $\begin{pmatrix} 1 & 2 \\ 3 & -7 & 5\end{matrix}\right]$   
•. We first compute  $T(\vec{e}_{1})$  using the following picture:  
 $\begin{pmatrix} 1 & 2 \\ 3 & -7 & 5\end{matrix}\right]$   
•. We now compute  $T(\vec{e}_{1})$  using the following picture:  
 $\begin{pmatrix} 1 & 2 \\ 3 & -7 & 5\end{matrix}\right]$   
 $\begin{pmatrix} 1 & 2 \\ 3 & -7 & 5\end{matrix}\right]$   
 $\begin{pmatrix} 1 & 2 \\ 3 & -7 & 5\end{matrix}\right]$   
•. We now compute  $T(\vec{e}_{3})$  using the following picture:
