

MATH 1A MIDTERM 1 (001)
PROFESSOR PAULIN

**DO NOT TURN OVER UNTIL
INSTRUCTED TO DO SO.**

CALCULATORS ARE NOT PERMITTED

**YOU MAY USE YOUR OWN BLANK
PAPER FOR ROUGH WORK**

**SO AS NOT TO DISTURB OTHER
STUDENTS, EVERYONE MUST STAY
UNTIL THE EXAM IS COMPLETE**

**REMEMBER THIS EXAM IS GRADED BY
A HUMAN BEING. WRITE YOUR
SOLUTIONS NEATLY AND
COHERENTLY, OR THEY RISK NOT
RECEIVING FULL CREDIT**

**THIS EXAM WILL BE ELECTRONICALLY
SCANNED. MAKE SURE YOU WRITE ALL
SOLUTIONS IN THE SPACES PROVIDED.
YOU MAY WRITE SOLUTIONS ON THE
BLANK PAGE AT THE BACK BUT BE
SURE TO CLEARLY LABEL THEM**

Name: _____

Student ID: _____

GSI's name: _____

This exam consists of 5 questions. Answer the questions in the spaces provided.

1. Determine the domains of the following functions:

(a) (15 points)

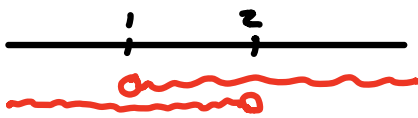

$$\ln\left(\frac{1-x}{x-2}\right)$$

Solution:

$$\frac{1-x}{x-2} > 0$$

$\begin{matrix} \nearrow \\ \searrow \end{matrix}$
 $\begin{matrix} 1-x > 0 \\ x-2 > 0 \end{matrix} \Leftrightarrow \begin{matrix} 1 > x \\ x > 2 \end{matrix} \leftarrow \text{No solutions}$

$\stackrel{=}{=} \begin{matrix} 1-x < 0 \\ x-2 < 0 \end{matrix} \Leftrightarrow \begin{matrix} 1 < x \\ x < 2 \end{matrix} \Leftrightarrow x \text{ in } (1, 2)$

$$\Rightarrow \text{Domain of } \ln\left(\frac{1-x}{x-2}\right) \text{ is } (1, 2)$$

(b) (10 points)

$$\frac{1}{\sqrt{\arccos(x)}}$$

Solution:

closed open

↓ ↓

$$\arccos(x) > 0 \Leftrightarrow x \text{ in } [-1, 1)$$

$$\Rightarrow \text{Domain of } \frac{1}{\sqrt{\arccos(x)}} \text{ is } [-1, 1)$$

PLEASE TURN OVER

2. (a) (15 points) Describe in words, how, starting with the graph $y = 2 + 3f(1 - x)$, one can draw the graph

$$y = 1 - 3f(2x + 1).$$

Solution:

$$\begin{array}{ccccccc}
 y = 2 + 3f(1-x) & \xrightarrow{\text{Reflect in } y\text{-axis}} & y = 2 + 3f(1+x) & \xrightarrow{\text{Compress horizontally by factor 2}} & 2 + 3f(1+2x) & & \\
 & & & & & \downarrow \text{Reflect in } x\text{-axis} & \\
 & & & \xleftarrow{\text{Translate up by 3}} & -2 - 3f(1+2x) & & \\
 & & (-3f(1+2x)) & & & &
 \end{array}$$

- (b) (10 points) Simplify the following:

$$\arccos(\cos(4))$$

Solution:

$$\begin{array}{l}
 \text{in } [0, \pi] \\
 \downarrow \\
 \cos(4) = \cos(2\pi - 4) \\
 \Rightarrow \arccos(\cos(4)) = 2\pi - 4
 \end{array}$$

PLEASE TURN OVER

3. Calculate (using the limit laws) the following limits. If a limit does not exist determine if it is ∞ , $-\infty$ or neither.

(a) (15 points)

$$\lim_{x \rightarrow \pi/2^+} \frac{x^2 + 1}{1 - \sin(x)}$$

Solution:

continuous

$$\lim_{x \rightarrow \frac{\pi}{2}^+} x^2 + 1 = \frac{\pi^2}{4} + 1 > 0$$

$$\lim_{x \rightarrow \frac{\pi}{2}^+} 1 - \sin(x) = 0^+$$

$$\Rightarrow \lim_{x \rightarrow \frac{\pi}{2}^+} \frac{x^2 + 1}{1 - \sin(x)} = \infty$$

(b) (10 points)

$$\lim_{x \rightarrow \infty} \arcsin\left(\frac{x^2 - 2x + 1}{2x^2 + 3x + 1}\right)$$

Solution:

$$\lim_{x \rightarrow \infty} \frac{x^2 - 2x + 1}{2x^2 + 3x + 1} = \frac{1}{2}$$

deg(x^2 - 2x + 1) = deg(2x^2 + 3x + 1)

arcsin continuous at 1/2

$$\Rightarrow \lim_{x \rightarrow \infty} \arcsin\left(\frac{x^2 - 2x + 1}{2x^2 + 3x + 1}\right) = \arcsin\left(\frac{1}{2}\right) = \frac{\pi}{6}$$

4. (25 points) Let $f(x) = \begin{cases} 1 & \text{if } x \leq 1 \\ 3 - 2x & \text{if } x > 1 \end{cases}$.

Prove, using ϵ, δ methods, that f is continuous at $x = 1$.

Solution:

Claim : $\lim_{x \rightarrow 1} f(x) = f(1) = 1$
 Fix $\epsilon > 0$

\Rightarrow Choose $\delta = \frac{\epsilon}{2}$

$3 - 2x = 1 - \epsilon \Rightarrow x = 1 + \frac{\epsilon}{2}$

$|2x - 2|$
 $\quad \quad \quad "$
 $|-2x + 2|$
 $\quad \quad \quad "$

$0 < |x - 1| < \frac{\epsilon}{2} \Rightarrow 2|x - 1| < \epsilon \Rightarrow |2x - 2| < \epsilon \Rightarrow |(3 - 2x) - 1| < \epsilon$

$\uparrow \quad x > 1$

$\uparrow \quad x > 1$

$0 < |x - 1| < \frac{\epsilon}{2}$

$|f(x) - 1| < \epsilon$

$\downarrow \quad x \leq 1$

Hence $0 < |x - 1| < \frac{\epsilon}{2} \Rightarrow |f(x) - 1| < \epsilon$

$|1 - 1| = 0 < \epsilon$

$\Rightarrow \lim_{x \rightarrow 1} f(x) = f(1)$

\nearrow
 always true
 so nothing to check

5. (25 points) Does there exist a tangent line to the curve

$$y = \frac{x+2}{x+1}$$

which contains the point $(-1, 1)$? Carefully justify your answer. If you calculate a derivative do so using the limit definition. You do not need to use ϵ, δ methods.

Solution:

$$f(x) = \frac{x+2}{x+1}$$

$$\begin{aligned} f'(a) &= \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h} = \lim_{h \rightarrow 0} \frac{\frac{a+h+2}{a+h+1} - \frac{a+2}{a+1}}{h} \\ &= \lim_{h \rightarrow 0} \frac{(a+h+2)(a+1) - (a+2)(a+h+1)}{h(a+h+1)(a+1)} \\ &= \lim_{h \rightarrow 0} \frac{\cancel{a^2} + \cancel{ah} + \cancel{2a} + \cancel{a+h+2} - \cancel{a^2} - \cancel{ah} - \cancel{a} - \cancel{2a} - \cancel{2h} - \cancel{2}}{h(a+h+1)(a+1)} \\ &= \lim_{h \rightarrow 0} \frac{-1}{(a+h+1)(a+1)} = \frac{-1}{(a+1)^2} \end{aligned}$$

$$\text{Equation of tangent at } x = a: y - \frac{a+2}{a+1} = \frac{-1}{(a+1)^2} (x-a)$$

$$(-1, 1) \text{ on tangent} \Rightarrow 1 - \frac{a+2}{a+1} = \frac{-1}{(a+1)^2} (-1-a)$$

$$\Leftrightarrow 1 - \frac{a+2}{a+1} = \frac{1}{a+1} \Rightarrow a+1 - (a+2) = 1 \Rightarrow -1 = 1$$

Hence no tangent contains $(-1, 1)$. ↑
not true
