RIMS, Kyoto University

Beem-Lemos-Liendo-Peelaers-Rastelli-van Rees '15 ([BL²PRvR]):

4D/2D Correspondence

Beem-Lemos-Liendo-Peelaers-Rastelli-van Rees '15 ([BL²PRvR]):

$$\mathbb{V} : \{4D \mathcal{N} = 2 \text{ SCFTs}\} \longrightarrow \{2D \text{ chiral CFTs (VOAs)}\}$$

4D/2D Correspondence

Beem-Lemos-Liendo-Peelaers-Rastelli-van Rees '15 ([BL²PRvR]):

$$\mathbb{V} : \{4\text{D } \mathcal{N} = 2 \text{ SCFTs}\} \longrightarrow \{2\text{D chiral CFTs (VOAs)}\}$$

s.t.

$$\text{the Schur index of } \mathcal{T} = \chi_{\mathbb{V}}(\mathcal{T}) := \text{tr}_{\mathbb{V}(\mathcal{T})}(q^{L_0 - c_{\chi}(\mathcal{V})/24}).$$

4D/2D Correspondence

Beem-Lemos-Liendo-Peelaers-Rastelli-van Rees '15 ([BL²PRvR]):

$$\mathbb{V} : \{4\text{D } \mathcal{N} = 2 \text{ SCFTs}\} \longrightarrow \{2\text{D chiral CFTs (VOAs)}\}$$

s.t.

$$\text{the Schur index of } \mathcal{T} = \chi_{\mathbb{V}(\mathcal{T})} := \text{tr}_{\mathbb{V}(\mathcal{T})}(q^{L_0 - c_{\chi(\mathcal{V})}/24}).$$

- \mathbb{V} is injective in examples so far.

4D/2D Correspondence

Beem-Lemos-Liendo-Peelaers-Rastelli-van Rees '15 ([BL²PRvR]):

$$\mathbb{V} : \{4\text{D } \mathcal{N} = 2 \text{ SCFTs}\} \longrightarrow \{2\text{D chiral CFTs (VOAs)}\}$$

s.t.

the Schur index of $\mathcal{T} = \chi_{\mathbb{V}(\mathcal{T})} := \text{tr}_{\mathbb{V}(\mathcal{T})}(q^{L_0 - c_{\chi(\mathcal{V})}/24})$.

- \mathbb{V} is injective in examples so far.
- $\mathbb{V}(\mathcal{T})$ is never unitary

4D/2D Correspondence

Beem-Lemos-Liendo-Peelaers-Rastelli-van Rees '15 ([BL²PRvR]):

$$\mathbb{V} : \{4D \mathcal{N} = 2 \text{ SCFTs}\} \longrightarrow \{2D \text{ chiral CFTs (VOAs)}\}$$

s.t.

the Schur index of $\mathcal{T} = \chi_{\mathbb{V}(\mathcal{T})} := \text{tr}_{\mathbb{V}(\mathcal{T})}(q^{L_0 - c_{\mathbb{V}(\mathcal{T})}/24})$.

- \mathbb{V} is injective in examples so far.
- $\mathbb{V}(\mathcal{T})$ is never unitary (reason: $c_{2D} = -12c_{4D}$).

4D/2D Correspondence

Beem-Lemos-Liendo-Peelaers-Rastelli-van Rees '15 ([BL²PRvR]):

$$\mathbb{V} : \{4D \mathcal{N} = 2 \text{ SCFTs}\} \longrightarrow \{2D \text{ chiral CFTs (VOAs)}\}$$

s.t.

the Schur index of $\mathcal{T} = \chi_{\mathbb{V}(\mathcal{T})} := \text{tr}_{\mathbb{V}(\mathcal{T})}(q^{L_0 - c_{\mathbb{V}(\mathcal{T})}/24})$.

- \mathbb{V} is injective in examples so far.
- $\mathbb{V}(\mathcal{T})$ is never unitary (reason: $c_{2D} = -12c_{4D}$). In particular, \mathbb{V} is not surjective.

Beem-Rastelli Conjecture

Conjecture (Beem-Rastelli '18)

Beem-Rastelli Conjecture

Conjecture (Beem-Rastelli '18)

For any 4D $\mathcal{N} = 2$ SCFT \mathcal{T} ,

Beem-Rastelli Conjecture

Conjecture (Beem-Rastelli '18)

For any 4D $\mathcal{N} = 2$ SCFT \mathcal{T} , we have

$$\text{Higgs}(\mathcal{T}) \cong X_{V(\mathcal{T})},$$

where X_V is the associated variety of a VOA V .

Beem-Rastelli Conjecture

Conjecture (Beem-Rastelli '18)

For any 4D $\mathcal{N} = 2$ SCFT \mathcal{T} , we have

$$\text{Higgs}(\mathcal{T}) \cong X_{V(\mathcal{T})},$$

where X_V is the associated variety of a VOA V .

The associated variety is defined as

$$X_V = \text{Specm } R_V,$$

where $R_V = V/C_2(V)$ is Zhu's C_2 algebra of V defined as follows:

Beem-Rastelli Conjecture

Conjecture (Beem-Rastelli '18)

For any 4D $\mathcal{N} = 2$ SCFT \mathcal{T} , we have

$$\text{Higgs}(\mathcal{T}) \cong X_{V(\mathcal{T})},$$

where X_V is the associated variety of a VOA V .

The associated variety is defined as

$$X_V = \text{Specm } R_V,$$

where $R_V = V/C_2(V)$ is Zhu's C_2 algebra of V defined as follows:

By the state-field correspondence we can write

$$V = \text{span}_{\mathbb{C}} \{ \circ (\partial^{n_1} a_1(z)) \dots (\partial^{n_r} a_r(z)) \circ \}.$$

Beem-Rastelli Conjecture

Conjecture (Beem-Rastelli '18)

For any 4D $\mathcal{N} = 2$ SCFT \mathcal{T} , we have

$$\text{Higgs}(\mathcal{T}) \cong X_{V(\mathcal{T})},$$

where X_V is the associated variety of a VOA V .

The associated variety is defined as

$$X_V = \text{Specm } R_V,$$

where $R_V = V/C_2(V)$ is Zhu's C_2 algebra of V defined as follows:

By the state-field correspondence we can write

$$V = \text{span}_{\mathbb{C}} \{ \circ (\partial^{n_1} a_1(z)) \dots (\partial^{n_r} a_r(z)) \circ \}.$$

$C_2(V)$ is the subspace of V spanned by the elements of the above form with $n_1 + \dots + n_r \geq 1$.

Beem-Rastelli Conjecture

$$\Rightarrow R_V = V/C_2(V)$$

Beem-Rastelli Conjecture

$\Rightarrow R_V = V/C_2(V)$ is a Poisson algebra by

$$\overline{f(z).g(z)} = \overline{\circ f(z)g(z) \circ},$$

Beem-Rastelli Conjecture

$\Rightarrow R_V = V/C_2(V)$ is a Poisson algebra by

$$\overline{f(z) \cdot g(z)} = \overline{\circ f(z)g(z) \circ},$$

$$\{\overline{f(z)}, \overline{g(z)}\} = \overline{\text{Res}_{w=z} f(w)g(z)}.$$

$\Rightarrow R_V = V/C_2(V)$ is a Poisson algebra by

$$\overline{f(z) \cdot g(z)} = \overline{\circ f(z)g(z) \circ},$$

$$\{\overline{f(z)}, \overline{g(z)}\} = \overline{\text{Res}_{w=z} f(w)g(z)}.$$

Remark

The Higgs branch $\text{Higgs}(\mathcal{T})$ is a hyperkähler cone,

$\Rightarrow R_V = V/C_2(V)$ is a Poisson algebra by

$$\overline{f(z) \cdot g(z)} = \overline{\circ f(z)g(z) \circ},$$

$$\{\overline{f(z)}, \overline{g(z)}\} = \overline{\text{Res}_{w=z} f(w)g(z)}.$$

Remark

The Higgs branch $\text{Higgs}(\mathcal{T})$ is a hyperkähler cone, while the associated variety X_V of a VOA V is only a Poisson variety in general.

Examples of associated varieties

$\widehat{\mathfrak{g}} = \mathfrak{g}[t, t^{-1}] \oplus \mathbb{C}K$ affine Kac-Moody algebra associated with \mathfrak{g}

Examples of associated varieties

$\widehat{\mathfrak{g}} = \mathfrak{g}[t, t^{-1}] \oplus \mathbb{C}K$ affine Kac-Moody algebra associated with \mathfrak{g}
 $V^k(\mathfrak{g}) = U(\widehat{\mathfrak{g}}) \otimes_{U(\mathfrak{g}[t] \oplus \mathbb{C}K)} \mathbb{C}_k$ the universal affine vertex algebra associated with \mathfrak{g} at level $k \in \mathbb{C}$.

Examples of associated varieties

$\widehat{\mathfrak{g}} = \mathfrak{g}[t, t^{-1}] \oplus \mathbb{C}K$ affine Kac-Moody algebra associated with \mathfrak{g}
 $V^k(\mathfrak{g}) = U(\widehat{\mathfrak{g}}) \otimes_{U(\mathfrak{g}[t] \oplus \mathbb{C}K)} \mathbb{C}_k$ the universal affine vertex algebra associated with \mathfrak{g} at level $k \in \mathbb{C}$.

$V^k(\mathfrak{g})$ is generated by $x(z)$ ($x \in \mathfrak{g}$) with OPEs

$$x(z)y(w) \sim [x, y](w)/(z - w) + k(x|y)/(z - w)^2.$$

(a $V^k(\mathfrak{g})$ -module = a smooth $\widehat{\mathfrak{g}}$ -module of level k)

Examples of associated varieties

$\widehat{\mathfrak{g}} = \mathfrak{g}[t, t^{-1}] \oplus \mathbb{C}K$ affine Kac-Moody algebra associated with \mathfrak{g}
 $V^k(\mathfrak{g}) = U(\widehat{\mathfrak{g}}) \otimes_{U(\mathfrak{g}[t] \oplus \mathbb{C}K)} \mathbb{C}_k$ the universal affine vertex algebra associated with \mathfrak{g} at level $k \in \mathbb{C}$.

$V^k(\mathfrak{g})$ is generated by $x(z)$ ($x \in \mathfrak{g}$) with OPEs

$$x(z)y(w) \sim [x, y](w)/(z - w) + k(x|y)/(z - w)^2.$$

(a $V^k(\mathfrak{g})$ -module = a smooth $\widehat{\mathfrak{g}}$ -module of level k)

We have

$$X_{V^k(\mathfrak{g})} = \mathfrak{g}^*.$$

Examples of associated varieties

$\widehat{\mathfrak{g}} = \mathfrak{g}[t, t^{-1}] \oplus \mathbb{C}K$ affine Kac-Moody algebra associated with \mathfrak{g}
 $V^k(\mathfrak{g}) = U(\widehat{\mathfrak{g}}) \otimes_{U(\mathfrak{g}[t] \oplus \mathbb{C}K)} \mathbb{C}_k$ the universal affine vertex algebra associated with \mathfrak{g} at level $k \in \mathbb{C}$.

$V^k(\mathfrak{g})$ is generated by $x(z)$ ($x \in \mathfrak{g}$) with OPEs

$$x(z)y(w) \sim [x, y](w)/(z - w) + k(x|y)/(z - w)^2.$$

(a $V^k(\mathfrak{g})$ -module = a smooth $\widehat{\mathfrak{g}}$ -module of level k)

We have

$$X_{V^k(\mathfrak{g})} = \mathfrak{g}^*.$$

$L_k(\mathfrak{g})$ the simple quotient of $V^k(\mathfrak{g})$

Examples of associated varieties

$\widehat{\mathfrak{g}} = \mathfrak{g}[t, t^{-1}] \oplus \mathbb{C}K$ affine Kac-Moody algebra associated with \mathfrak{g}
 $V^k(\mathfrak{g}) = U(\widehat{\mathfrak{g}}) \otimes_{U(\mathfrak{g}[t] \oplus \mathbb{C}K)} \mathbb{C}_k$ the universal affine vertex algebra associated with \mathfrak{g} at level $k \in \mathbb{C}$.

$V^k(\mathfrak{g})$ is generated by $x(z)$ ($x \in \mathfrak{g}$) with OPEs

$$x(z)y(w) \sim [x, y](w)/(z - w) + k(x|y)/(z - w)^2.$$

(a $V^k(\mathfrak{g})$ -module = a smooth $\widehat{\mathfrak{g}}$ -module of level k)

We have

$$X_{V^k(\mathfrak{g})} = \mathfrak{g}^*.$$

$L_k(\mathfrak{g})$ the simple quotient of $V^k(\mathfrak{g})$

$$X_{L_k(\mathfrak{g})} \subset \mathfrak{g}^*, \quad G\text{-invariant and conic.}$$

Example of VOA coming from 4D $\mathcal{N} = 2$ SCFT

- $L_k(\mathfrak{g})$ is integrable ($k \in \mathbb{Z}_{\geq 0}$) $\Rightarrow X_{L_k(\mathfrak{g})} = \{0\}$ (a fat point).

Example of VOA coming from 4D $\mathcal{N} = 2$ SCFT

- $L_k(\mathfrak{g})$ is integrable ($k \in \mathbb{Z}_{\geq 0}$) $\Rightarrow X_{L_k(\mathfrak{g})} = \{0\}$ (a fat point).
In fact, the converse is true.

Example of VOA coming from 4D $\mathcal{N} = 2$ SCFT

- $L_k(\mathfrak{g})$ is integrable ($k \in \mathbb{Z}_{\geq 0}$) $\Rightarrow X_{L_k(\mathfrak{g})} = \{0\}$ (a fat point).
In fact, the converse is true.
- In general, a VOA V is called *lisse* (or C_2 -cofinite) if $\dim X_V = 0$.

Example of VOA coming from 4D $\mathcal{N} = 2$ SCFT

- $L_k(\mathfrak{g})$ is integrable ($k \in \mathbb{Z}_{\geq 0}$) $\Rightarrow X_{L_k(\mathfrak{g})} = \{0\}$ (a fat point).
In fact, the converse is true.
- In general, a VOA V is called *lisse* (or C_2 -cofinite) if $\dim X_V = 0$. A lisse VOA has very nice properties such as finiteness of simple modules, the modularity of characters, and the existence of the vertex tensor categories ([Yongchang Zhu, Gaberdiel-Neitzke, Miyamoto, Yi-Zhi Huang])

Example of VOA coming from 4D $\mathcal{N} = 2$ SCFT

Together with Beem-Rastelli conjecture,

Theorem (A.-Kawasetsu'18)

Let V be a quasi-lisse VOA.

- 1) There exists only finitely many simple ordinary representations of V ;*
- 2) For an ordinary representation M , $\text{tr}_M(q^{L_0 - c_X(V)/24})$ converges to a holomorphic function on the upper half plane. Moreover, $\{\text{tr}_M(q^{L_0 - c_X(V)/24}) \mid M \text{ ordinary}\}$ is a subspace of the space of the solutions of a modular linear differential equation (MLDE).*

Together with Beem-Rastelli conjecture, the above theorem implies the modularity of the Schur index of a 4D $\mathcal{N} = 2$ SCFT.

Beem-Rastelli Conjecture for Class \mathcal{S} theory

The theory of class \mathcal{S} ([Gaiotto'12])

Beem-Rastelli Conjecture for Class \mathcal{S} theory

The theory of class \mathcal{S} ([Gaiotto'12])

$$\left\{ \mathcal{S}_G(\Sigma) \mid \Sigma: \text{a punctured Riemann surface,} \right.$$

Beem-Rastelli Conjecture for Class \mathcal{S} theory

The theory of class \mathcal{S} ([Gaiotto'12])

$$\left\{ \mathcal{S}_G(\Sigma) \mid \begin{array}{l} \Sigma: \text{a punctured Riemann surface,} \\ G: \text{complex semisimple group} \end{array} \right\}$$

Beem-Rastelli Conjecture for Class \mathcal{S} theory

The theory of class \mathcal{S} ([Gaiotto'12])

$$\left\{ S_G(\Sigma) \mid \begin{array}{l} \Sigma: \text{a punctured Riemann surface,} \\ G: \text{complex semisimple group} \end{array} \right\}$$

- Moore-Tachikawa'12 gave a mathematical description of the Higgs branch of $S_G(\Sigma)$ in terms of 2D TQFT,

Beem-Rastelli Conjecture for Class \mathcal{S} theory

The theory of class \mathcal{S} ([Gaiotto'12])

$$\left\{ S_G(\Sigma) \mid \begin{array}{l} \Sigma: \text{a punctured Riemann surface,} \\ G: \text{complex semisimple group} \end{array} \right\}$$

- Moore-Tachikawa'12 gave a mathematical description of the Higgs branch of $S_G(\Sigma)$ in terms of 2D TQFT, up to a conjecture.

Beem-Rastelli Conjecture for Class \mathcal{S} theory

The theory of class \mathcal{S} ([Gaiotto'12])

$$\left\{ S_G(\Sigma) \mid \begin{array}{l} \Sigma: \text{a punctured Riemann surface,} \\ G: \text{complex semisimple group} \end{array} \right\}$$

- Moore-Tachikawa'12 gave a mathematical description of the Higgs branch of $S_G(\Sigma)$ in terms of 2D TQFT, up to a conjecture.
- This Moore-Tachikawa conjecture was proved by Braverman-Finkelberg-Nakajima'19.

Beem-Rastelli Conjecture for Class \mathcal{S} theory

The theory of class \mathcal{S} ([Gaiotto'12])

$$\left\{ S_G(\Sigma) \mid \begin{array}{l} \Sigma: \text{a punctured Riemann surface,} \\ G: \text{complex semisimple group} \end{array} \right\}$$

- Moore-Tachikawa'12 gave a mathematical description of the Higgs branch of $S_G(\Sigma)$ in terms of 2D TQFT, up to a conjecture.
- This Moore-Tachikawa conjecture was proved by Braverman-Finkelberg-Nakajima'19.

According to Moore-Tachikawa, it is sufficient to describe $\text{Higgs}(S_G(\Sigma))$ for genus zero Σ .

Theorem (BFN'19)

For $r \geq 1$, define MT_r

Theorem (BFN'19)

For $r \geq 1$, define $\text{MT}_r := \text{Spec} \left(H_{\check{G}[[t]]}^* (\text{Gr}_{\check{G}}, i_{\Delta}^! (\mathcal{A}_R^{\boxtimes r})) \right)$, where \check{G} is the Langlands dual of G , $\text{Gr}_{\check{G}} = \check{G}((t))/\check{G}[[t]]$, $i_{\Delta} : \text{Gr}_{\check{G}} \rightarrow \underbrace{\text{Gr}_{\check{G}} \times \cdots \times \text{Gr}_{\check{G}}}_r$ is the diagonal embedding, and \mathcal{A}_R is the perverse sheaf corresponding to the regular representation of \check{G} via the geometric Satake correspondence.

Theorem (BFN'19)

For $r \geq 1$, define $MT_r := \text{Spec} \left(H_{\check{G}[[t]]}^* (\text{Gr}_{\check{G}}, i_{\Delta}^! (\mathcal{A}_R^{\boxtimes r})) \right)$, where \check{G} is the Langlands dual of G , $\text{Gr}_{\check{G}} = \check{G}((t))/\check{G}[[t]]$, $i_{\Delta} : \text{Gr}_{\check{G}} \rightarrow \overbrace{\text{Gr}_{\check{G}} \times \cdots \times \text{Gr}_{\check{G}}}^r$ is the diagonal embedding, and \mathcal{A}_R is the perverse sheaf corresponding to the regular representation of \check{G} via the geometric Satake correspondence. Then

- 1) MT_r is a (possibly singular) symplectic variety equipped with a Hamiltonian action of \check{G}^r ;

Theorem (BFN'19)

For $r \geq 1$, define $MT_r := \text{Spec} \left(H_{\check{G}[[t]]}^* \left(\text{Gr}_{\check{G}}, i_{\Delta}^! (\mathcal{A}_R^{\boxtimes r}) \right) \right)$, where \check{G} is the Langlands dual of G , $\text{Gr}_{\check{G}} = \check{G}((t))/\check{G}[[t]]$, $i_{\Delta} : \text{Gr}_{\check{G}} \rightarrow \underbrace{\text{Gr}_{\check{G}} \times \cdots \times \text{Gr}_{\check{G}}}_r$ is the diagonal embedding, and \mathcal{A}_R is the perverse sheaf corresponding to the regular representation of \check{G} via the geometric Satake correspondence. Then

- 1) MT_r is a (possibly singular) symplectic variety equipped with a Hamiltonian action of \check{G}^r ;
- 2) MT_2

Theorem (BFN'19)

For $r \geq 1$, define $MT_r := \text{Spec} \left(H_{\check{G}[[t]]}^* (\text{Gr}_{\check{G}}, i_{\Delta}^! (\mathcal{A}_R^{\boxtimes r})) \right)$, where \check{G} is the Langlands dual of G , $\text{Gr}_{\check{G}} = \check{G}((t))/\check{G}[[t]]$, $i_{\Delta} : \text{Gr}_{\check{G}} \rightarrow \underbrace{\text{Gr}_{\check{G}} \times \cdots \times \text{Gr}_{\check{G}}}_r$ is the diagonal embedding, and \mathcal{A}_R is the perverse sheaf corresponding to the regular representation of \check{G} via the geometric Satake correspondence. Then

- 1) MT_r is a (possibly singular) symplectic variety equipped with a Hamiltonian action of \check{G}^r ;
- 2) $MT_2 = T^*G$,

Theorem (BFN'19)

For $r \geq 1$, define $MT_r := \text{Spec} \left(H_{\check{G}[[t]]}^* (\text{Gr}_{\check{G}}, i_{\Delta}^! (\mathcal{A}_R^{\boxtimes r})) \right)$, where \check{G} is the Langlands dual of G , $\text{Gr}_{\check{G}} = \check{G}((t))/\check{G}[[t]]$, $i_{\Delta} : \text{Gr}_{\check{G}} \rightarrow \overbrace{\text{Gr}_{\check{G}} \times \cdots \times \text{Gr}_{\check{G}}}^r$ is the diagonal embedding, and \mathcal{A}_R is the perverse sheaf corresponding to the regular representation of \check{G} via the geometric Satake correspondence. Then

- 1) MT_r is a (possibly singular) symplectic variety equipped with a Hamiltonian action of \check{G}^r ;
- 2) $MT_2 = T^*G$, $MT_1 = G \times \mathcal{S}$, where $\mathcal{S} \subset \mathfrak{g}^*$ is the Kostant-Slodowy slice ;

Theorem (BFN'19)

For $r \geq 1$, define $MT_r := \text{Spec} \left(H_{\check{G}[[t]]}^* (\text{Gr}_{\check{G}}, i_{\Delta}^! (\mathcal{A}_R^{\boxtimes r})) \right)$, where \check{G} is the Langlands dual of G , $\text{Gr}_{\check{G}} = \check{G}((t))/\check{G}[[t]]$, $i_{\Delta} : \text{Gr}_{\check{G}} \rightarrow \overbrace{\text{Gr}_{\check{G}} \times \cdots \times \text{Gr}_{\check{G}}}^r$ is the diagonal embedding, and \mathcal{A}_R is the perverse sheaf corresponding to the regular representation of \check{G} via the geometric Satake correspondence. Then

- 1) MT_r is a (possibly singular) symplectic variety equipped with a Hamiltonian action of \check{G}^r ;
- 2) $MT_2 = T^*G$, $MT_1 = G \times \mathcal{S}$, where $\mathcal{S} \subset \mathfrak{g}^*$ is the Kostant-Slodowy slice ;
- 3) $MT_{r+s-2} \cong (MT_r \times MT_s) // \Delta(G)$ (the associativity).

Theorem (BFN'19)

For $r \geq 1$, define $MT_r := \text{Spec} \left(H_{\check{G}[[t]]}^* (\text{Gr}_{\check{G}}, i_{\Delta}^! (\mathcal{A}_R^{\boxtimes r})) \right)$, where \check{G} is the Langlands dual of G , $\text{Gr}_{\check{G}} = \check{G}((t))/\check{G}[[t]]$, $i_{\Delta} : \text{Gr}_{\check{G}} \rightarrow \overbrace{\text{Gr}_{\check{G}} \times \cdots \times \text{Gr}_{\check{G}}}^r$ is the diagonal embedding, and \mathcal{A}_R is the perverse sheaf corresponding to the regular representation of \check{G} via the geometric Satake correspondence. Then

- 1) MT_r is a (possibly singular) symplectic variety equipped with a Hamiltonian action of \check{G}^r ;
- 2) $MT_2 = T^*G$, $MT_1 = G \times \mathcal{S}$, where $\mathcal{S} \subset \mathfrak{g}^*$ is the Kostant-Slodowy slice ;
- 3) $MT_{r+s-2} \cong (MT_r \times MT_s) // \Delta(G)$ (the associativity).

We get:

$$MT_r = \text{Higgs}(S_G(\mathbb{P}^1 \text{ with } r \text{ pictures})).$$

We get:

$$MT_r = \text{Higgs}(S_G(\mathbb{P}^1 \text{ with } r \text{ pictures})).$$

For type A ,

We get:

$$\text{MT}_r = \text{Higgs}(S_G(\mathbb{P}^1 \text{ with } r \text{ pictures})).$$

For type A , Moore-Tachikawa variety MT_r is isomorphic to the Coulomb branch of the $3D$ gauge theory associated with the star shaped quiver with r -legs ([BFN]).

We get:

$$\text{MT}_r = \text{Higgs}(S_G(\mathbb{P}^1 \text{ with } r \text{ pictures})).$$

For type A , Moore-Tachikawa variety MT_r is isomorphic to the Coulomb branch of the $3D$ gauge theory associated with the star shaped quiver with r -legs ([BFN]).

$\Rightarrow \text{MT}_r$ has a finitely many symplectic leaves ([Weekes]).

$$\mathbf{V}_3 = L_{-3}(E_6).$$

In general, neither MT_r nor \mathbf{V}_r has a simple description.

Some words on the proof

$\mathbf{V}_2 = \mathcal{D}_{G, -h^\vee}^{ch}$ should satisfy

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathcal{D}_{G, -h^\vee}^{ch} \otimes \mathbf{V}_r) \cong \mathbf{V}_r.$$

Some words on the proof

$\mathbf{V}_2 = \mathcal{D}_{G, -h^\vee}^{ch}$ should satisfy

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathcal{D}_{G, -h^\vee}^{ch} \otimes \mathbf{V}_r) \cong \mathbf{V}_r.$$

Why?

Some words on the proof

$\mathbf{V}_2 = \mathcal{D}_{G, -h^\vee}^{ch}$ should satisfy

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathcal{D}_{G, -h^\vee}^{ch} \otimes \mathbf{V}_r) \cong \mathbf{V}_r.$$

Why?

By definition,

$$\mathcal{D}_{G, -h^\vee}^{ch} \text{-Mod} \cong \mathcal{D}_{G((t))} \text{-Mod}_{-h^\vee}$$

([Arkhipov-Gaitsgory]).

Some words on the proof

$\mathbf{V}_2 = \mathcal{D}_{G, -h^\vee}^{ch}$ should satisfy

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathcal{D}_{G, -h^\vee}^{ch} \otimes \mathbf{V}_r) \cong \mathbf{V}_r.$$

Why?

By definition,

$$\mathcal{D}_{G, -h^\vee}^{ch} \text{-Mod} \cong \mathcal{D}_{G((t))} \text{-Mod}_{-h^\vee}$$

([Arkhipov-Gaitsgory]). Hence,

$$\mathcal{D}_{G, -h^\vee}^{ch} \text{-Mod}^{G[[t]]} \cong \mathcal{D}_{\text{Gr}_G} \text{-Mod}_{-h^\vee},$$

Some words on the proof

$\mathbf{V}_2 = \mathcal{D}_{G, -h^\vee}^{ch}$ should satisfy

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathcal{D}_{G, -h^\vee}^{ch} \otimes \mathbf{V}_r) \cong \mathbf{V}_r.$$

Why?

By definition,

$$\mathcal{D}_{G, -h^\vee}^{ch} \text{-Mod} \cong \mathcal{D}_{G((t))} \text{-Mod}_{-h^\vee}$$

([Arkhipov-Gaitsgory]). Hence,

$$\mathcal{D}_{G, -h^\vee}^{ch} \text{-Mod}^{G[[t]]} \cong \mathcal{D}_{\text{Gr}_G} \text{-Mod}_{-h^\vee},$$

where $\mathcal{D}_{G, -h^\vee}^{ch}$ itself corresponds to the δ -function D -module δ_e at the identity.

Some words on the proof

By restricting this equivalence, we get

$$\mathcal{D}_{G, -h^\vee}^{ch} \text{-Mod}^{G[[t]] \times G[[t]]} \cong \mathcal{D}_{\text{Gr}_G} \text{-Mod}_{-h^\vee}^{G[[t]]} \cong \text{Rep}(\check{G}).$$

Some words on the proof

By restricting this equivalence, we get

$$\mathcal{D}_{G, -h^\vee}^{ch} \text{-Mod}^{G[[t]] \times G[[t]]} \cong \mathcal{D}_{\text{Gr}_G} \text{-Mod}_{-h^\vee}^{G[[t]]} \cong \text{Rep}(\check{G}).$$

Via this equivalence the monoidal structure of

$\mathcal{D}_{G, -h^\vee}^{ch} \text{-Mod}^{G[[t]] \times G[[t]]}$ is given by

$$M \otimes N \mapsto H^{\infty/2+\bullet}(\widehat{\mathfrak{g}}, \mathfrak{g}, M \otimes N)$$

([Frenkel-Gaitsgory]).

Some words on the proof

By restricting this equivalence, we get

$$\mathcal{D}_{G, -h^\vee}^{ch} \text{-Mod}^{G[[t]] \times G[[t]]} \cong \mathcal{D}_{\text{Gr}_G} \text{-Mod}_{-h^\vee}^{G[[t]]} \cong \text{Rep}(\check{G}).$$

Via this equivalence the monoidal structure of

$\mathcal{D}_{G, -h^\vee}^{ch} \text{-Mod}^{G[[t]] \times G[[t]]}$ is given by

$$M \otimes N \mapsto H^{\infty/2+\bullet}(\widehat{\mathfrak{g}}, \mathfrak{g}, M \otimes N)$$

([Frenkel-Gaitsgory]). Because $\mathcal{D}_{G, -h^\vee}^{ch} \leftrightarrow \delta_e \leftrightarrow \mathbb{C}$,

Some words on the proof

By restricting this equivalence, we get

$$\mathcal{D}_{G, -h^\vee}^{ch} \text{-Mod}^{G[[t]] \times G[[t]]} \cong \mathcal{D}_{\text{Gr}_G} \text{-Mod}_{-h^\vee}^{G[[t]]} \cong \text{Rep}(\check{G}).$$

Via this equivalence the monoidal structure of

$\mathcal{D}_{G, -h^\vee}^{ch} \text{-Mod}^{G[[t]] \times G[[t]]}$ is given by

$$M \otimes N \mapsto H^{\infty/2+\bullet}(\widehat{\mathfrak{g}}, \mathfrak{g}, M \otimes N)$$

([Frenkel-Gaitsgory]). Because $\mathcal{D}_{G, -h^\vee}^{ch} \leftrightarrow \delta_e \leftrightarrow \mathbb{C}$,

$$H^{\infty/2+\bullet}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathcal{D}_{G, -h^\vee}^{ch} \otimes M) \cong M,$$

Some words on the proof

By restricting this equivalence, we get

$$\mathcal{D}_{G,-h^\vee}^{ch} \text{-Mod}^{G[[t]] \times G[[t]]} \cong \mathcal{D}_{Gr_G} \text{-Mod}_{-h^\vee}^{G[[t]]} \cong \text{Rep}(\check{G}).$$

Via this equivalence the monoidal structure of

$\mathcal{D}_{G,-h^\vee}^{ch} \text{-Mod}^{G[[t]] \times G[[t]]}$ is given by

$$M \otimes N \mapsto H^{\infty/2+\bullet}(\widehat{\mathfrak{g}}, \mathfrak{g}, M \otimes N)$$

([Frenkel-Gaitsgory]). Because $\mathcal{D}_{G,-h^\vee}^{ch} \leftrightarrow \delta_e \leftrightarrow \mathbb{C}$,

$$H^{\infty/2+\bullet}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathcal{D}_{G,-h^\vee}^{ch} \otimes M) \cong M,$$

and one can check this isomorphism holds for any $\widehat{\mathfrak{g}}$ -module M at the critical level on which the $\mathfrak{g}[[t]]$ -action integrates to the action of $G[[t]]$ ([Arkhipov-Gaitsgory]).

$\mathbf{V}_1 = H_{DS}^0(\mathcal{D}_{G,-h^\vee}^{ch})$ should satisfy

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathbf{V}_1 \otimes \mathbf{V}_r) \cong \delta_{i,0} \mathbf{V}_{r-1}.$$

$\mathbf{V}_1 = H_{DS}^0(\mathcal{D}_{G,-h^\vee}^{ch})$ should satisfy

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathbf{V}_1 \otimes \mathbf{V}_r) \cong \delta_{i,0} \mathbf{V}_{r-1}.$$

Proposition

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathbf{V}_1 \otimes M) \cong \delta_{i,0} H_{DS}^0(M).$$

$\mathbf{V}_1 = H_{DS}^0(\mathcal{D}_{G,-h^\vee}^{ch})$ should satisfy

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathbf{V}_1 \otimes \mathbf{V}_r) \cong \delta_{i,0} \mathbf{V}_{r-1}.$$

Proposition

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathbf{V}_1 \otimes M) \cong \delta_{i,0} H_{DS}^0(M).$$

$$\Rightarrow \mathbf{V}_{r-1} = H_{DS}^0(\mathbf{V}_r).$$

$\mathbf{V}_1 = H_{DS}^0(\mathcal{D}_{G,-h^\vee}^{ch})$ should satisfy

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathbf{V}_1 \otimes \mathbf{V}_r) \cong \delta_{i,0} \mathbf{V}_{r-1}.$$

Proposition

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathbf{V}_1 \otimes M) \cong \delta_{i,0} H_{DS}^0(M).$$

$$\Rightarrow \mathbf{V}_{r-1} = H_{DS}^0(\mathbf{V}_r).$$

So it is enough to construct an inverse functor to $H_{DS}^0(?)$.

Some words on the proof

$\mathbf{V}_1 = H_{DS}^0(\mathcal{D}_{G,-h^v}^{ch})$ should satisfy

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathbf{V}_1 \otimes \mathbf{V}_r) \cong \delta_{i,0} \mathbf{V}_{r-1}.$$

Proposition

$$H^{\infty/2+i}(\widehat{\mathfrak{g}}, \mathfrak{g}, \mathbf{V}_1 \otimes M) \cong \delta_{i,0} H_{DS}^0(M).$$

$$\Rightarrow \mathbf{V}_{r-1} = H_{DS}^0(\mathbf{V}_r).$$

So it is enough to construct an inverse functor to $H_{DS}^0(?)$.

Equivalently, we want to recover everything from \mathbf{V}_1 .

Example:

$$\mathbf{V}_2 = \mathcal{D}_G^{ch}$$

Example:

$V_2 = \mathcal{D}_G^{ch}$ has two commuting action of \hat{g} at the critical level

Example:

$V_2 = \mathcal{D}_G^{ch}$ has two commuting action of $\hat{\mathfrak{g}}$ at the critical level

V_1 has one action of $\hat{\mathfrak{g}}$ at the critical level

Example:

$V_2 = \mathcal{D}_G^{ch}$ has two commuting action of $\hat{\mathfrak{g}}$ at the critical level

V_1 has one action of $\hat{\mathfrak{g}}$ at the critical level

Easy guess:

Example:

$\mathbf{V}_2 = \mathcal{D}_G^{ch}$ has two commuting action of $\widehat{\mathfrak{g}}$ at the critical level

\mathbf{V}_1 has one action of $\widehat{\mathfrak{g}}$ at the critical level

Easy guess: $\mathbf{V}_2 = \mathbf{V}_1 \otimes \mathbf{V}_1$?

Example:

$\mathbf{V}_2 = \mathcal{D}_G^{ch}$ has two commuting action of $\widehat{\mathfrak{g}}$ at the critical level

\mathbf{V}_1 has one action of $\widehat{\mathfrak{g}}$ at the critical level

Easy guess: $\mathbf{V}_2 = \mathbf{V}_1 \otimes \mathbf{V}_1$?

No,

Example:

$\mathbf{V}_2 = \mathcal{D}_G^{ch}$ has two commuting action of $\widehat{\mathfrak{g}}$ at the critical level

\mathbf{V}_1 has one action of $\widehat{\mathfrak{g}}$ at the critical level

Easy guess: $\mathbf{V}_2 = \mathbf{V}_1 \otimes \mathbf{V}_1$?

No, because the action of the two Feigin-Frenkel center on

$\mathbf{V}_2 = \mathcal{D}_{G, -h^\vee}^{ch}$ is the same.

Example:

$\mathbf{V}_2 = \mathcal{D}_G^{ch}$ has two commuting action of $\widehat{\mathfrak{g}}$ at the critical level

\mathbf{V}_1 has one action of $\widehat{\mathfrak{g}}$ at the critical level

Easy guess: $\mathbf{V}_2 = \mathbf{V}_1 \otimes \mathbf{V}_1$?

No, because the action of the two Feigin-Frenkel center on

$\mathbf{V}_2 = \mathcal{D}_{G, -h^\vee}^{ch}$ is the same.

We can kill the difference of the two action of the center on $\mathbf{V}_1 \otimes \mathbf{V}_1$, or more generally,

Example:

$\mathbf{V}_2 = \mathcal{D}_G^{ch}$ has two commuting action of $\widehat{\mathfrak{g}}$ at the critical level

\mathbf{V}_1 has one action of $\widehat{\mathfrak{g}}$ at the critical level

Easy guess: $\mathbf{V}_2 = \mathbf{V}_1 \otimes \mathbf{V}_1$?

No, because the action of the two Feigin-Frenkel center on

$\mathbf{V}_2 = \mathcal{D}_{G, -h^\vee}^{ch}$ is the same.

We can kill the difference of the two action of the center on $\mathbf{V}_1 \otimes \mathbf{V}_1$, or more generally, on $\mathbf{V}_1^{\otimes r}$, using a certain BRST cohomology.

Construction of V_r

$\mathfrak{z}(\widehat{\mathfrak{g}})$: Feigin-Frenkel center of $\widehat{\mathfrak{g}}$ at the critical level generated by $p_1(z), \dots, p_{\text{rk}(\mathfrak{g})}(z)$.

Construction of \mathbf{V}_r

$\mathfrak{z}(\widehat{\mathfrak{g}})$: Feigin-Frenkel center of $\widehat{\mathfrak{g}}$ at the critical level generated by $p_1(z), \dots, p_{\text{rk}(\mathfrak{g})}(z)$.

$$\mathbf{V}_r := H_{BRST}^0(\mathbf{V}_1^{\otimes r} \otimes (\otimes_{i=1}^{\text{rk}(\mathfrak{g})} (b_i, c_i))^{\otimes r-1}, Q_{(0)})$$

where

$$Q(z) = \sum_{i=1}^{r-1} Q_{i,i+1}(z),$$

$$Q_{i,i+1}(z) = \sum_{j=1}^{\text{rk}(\mathfrak{g})} (\pi_i(p_j(z)) - \pi_{i+1}(p_j(z))) c_j^{(i)}(z).$$

Construction of \mathbf{V}_r

$\mathfrak{z}(\widehat{\mathfrak{g}})$: Feigin-Frenkel center of $\widehat{\mathfrak{g}}$ at the critical level generated by $p_1(z), \dots, p_{\text{rk}(\mathfrak{g})}(z)$.

$$\mathbf{V}_r := H_{BRST}^0(\mathbf{V}_1^{\otimes r} \otimes (\otimes_{i=1}^{\text{rk}(\mathfrak{g})} (b_i, c_i))^{\otimes r-1}, Q_{(0)})$$

where

$$Q(z) = \sum_{i=1}^{r-1} Q_{i,i+1}(z),$$

$$Q_{i,i+1}(z) = \sum_{j=1}^{\text{rk}(\mathfrak{g})} (\pi_i(p_j(z)) - \pi_{i+1}(p_j(z))) c_j^{(i)}(z).$$

One can check that the above defined \mathbf{V}_r satisfies the required properties. □.

Thank you!
