ON STATISTIC OF IRREDUCIBLE COMPONENTS

NICOLAI RESHETIKHIN

For finite dimensional representations $V_1, \ldots, V_m$ of a simple finite dimensional Lie algebra $\mathfrak{g}$ consider the tensor product $W = \otimes_{i=1}^{m} V_i^{N_i}$. The first result, which will be presented in the talk, is the asymptotic of the multiplicity of an irreducible representation $V_\lambda$ with the highest weight $\lambda$ in this tensor product when $N_i = \tau_i/\epsilon, \lambda = \xi/\epsilon$ and $\epsilon \to 0$. Then we will discuss the asymptotical distribution of irreducible components with respect to the character probability measure $\text{Prob}(\lambda) = \frac{m_\lambda \chi_{V_\lambda}(e^t)}{\chi_W(e^t)}$. Here $\chi_V(e^t)$ is the character of representation $V$ evaluated on $e^t$ where $t$ is an element of the Cartan subalgebra of the split real form of the Lie algebra $\mathfrak{g}$. This is a joint work with O. Postnova.
