## Question 1

Compute the following integrals. You may need to use either u-substitution, integration by parts, or both.

$$
\int \tan (x) d x
$$

(Hint: Trigonometry)

$$
\int x^{3} \sin \left(x^{2}\right) d x
$$

(Hint: $u$-substitution, then integration by parts)

$$
\begin{aligned}
& \int \arcsin (x) d x \\
& \int e^{\left(e^{x}+x\right)} d x
\end{aligned}
$$

(Hint: Rewrite using laws of exponents)

$$
\begin{gathered}
\int_{1}^{e} x \ln (x) d x \\
\int \sqrt{x} e^{\sqrt{x}} d x \\
\int_{1}^{e} \frac{1}{x+x(\ln (x))^{2}} d x \\
\int e^{x} \sin (2 x) d x \\
\int \frac{1}{x^{1 / 2}+x^{3 / 2}} d x
\end{gathered}
$$

(Hint: $u$-substitution)

## Question 2 (*)

Find a formula for positive integers $n$ for the following integrals.

$$
\begin{gathered}
\int x^{n} \ln (x) d x \\
\int x^{n} e^{x} d x \\
\int x^{n} e^{3 x} d x
\end{gathered}
$$

(Hint: How can you use your answer for the second integral to get an answer for the third integral?)
