Motivation

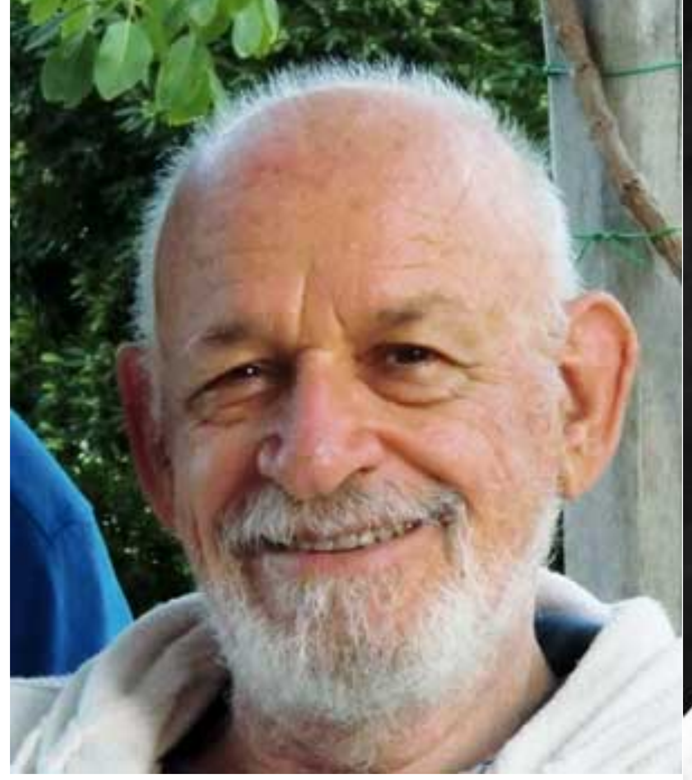
Quantum Geometry and Integrable Systems — [Okounkov et al] [Pushkar, Zeitlin, Smirnov] [PK, Pushkar, Smirnov, Zeitlin]

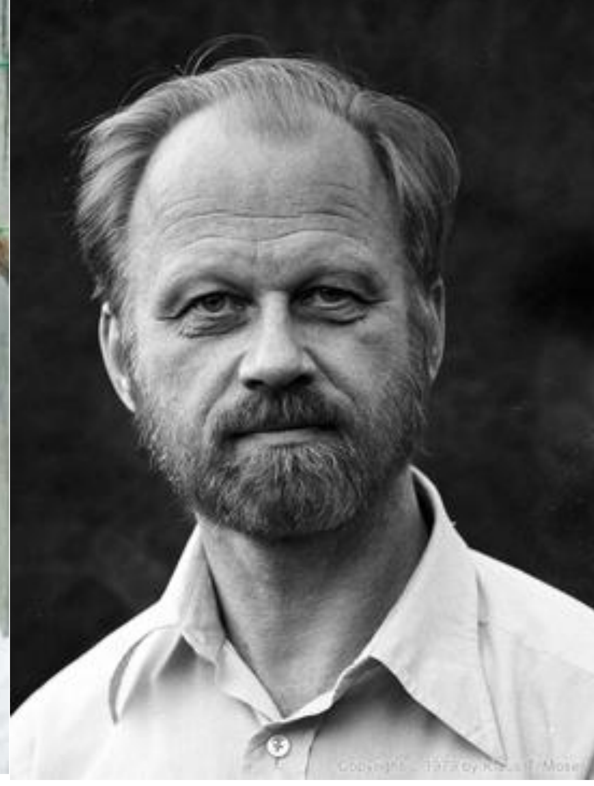
BPS/CFT Correspondence — [Nekrasov Shatashvili]

Geometric q-Langlands Correspondence — [Frenkel] [Aganagic, Frenkel, Okounkov]

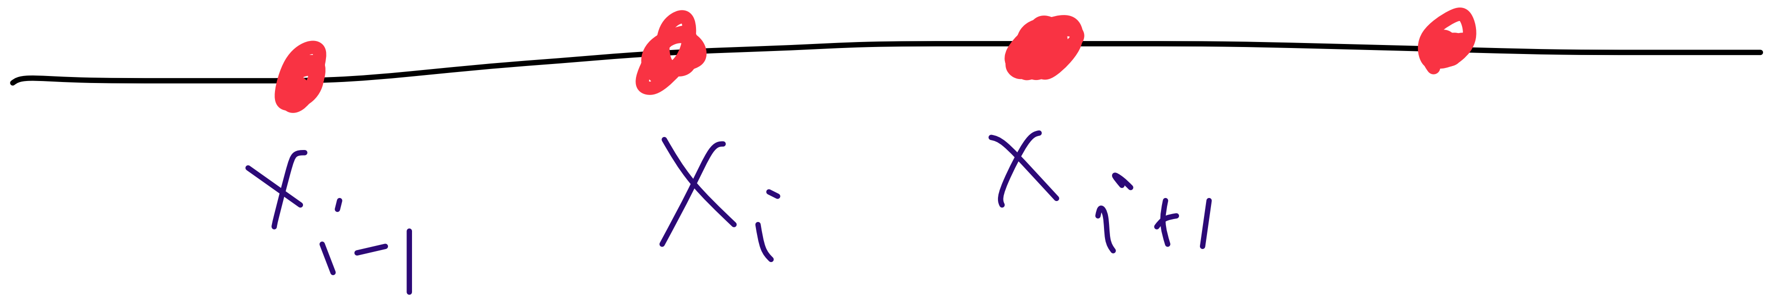
ODE/IM Correspondence — [Bazhanov, Lukyanov, Zamolodchikov] [Dorey, Tateo]

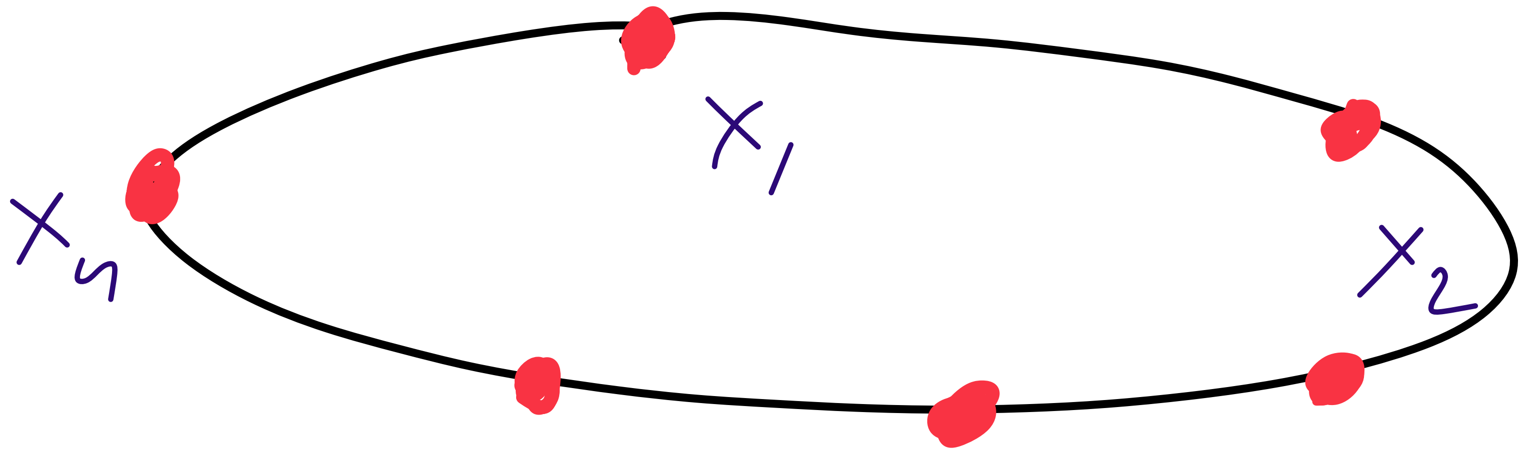
I. Integrable Many-Body Systems





Calogero in 1971 introduced a new integrable system. Moser in 1975 proved its integrability using Lax pair





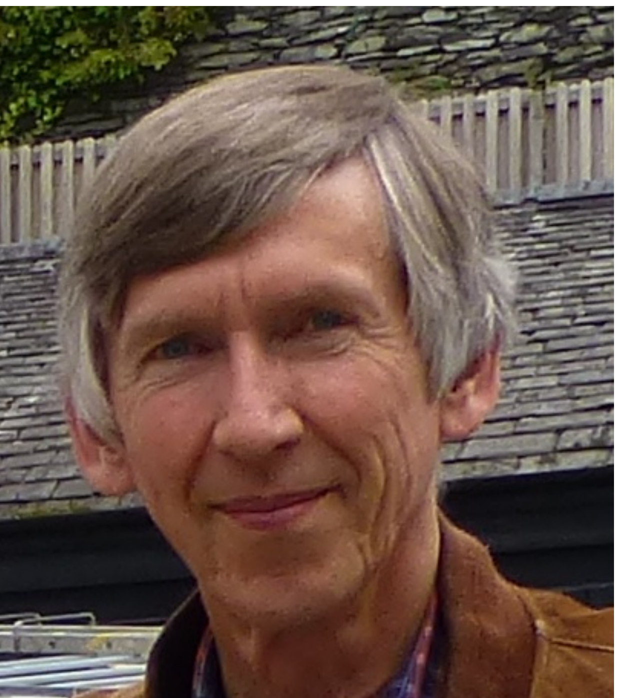
$$H_{CM} = \sum_{i=1}^{n} \frac{p_i^2}{2m} + g^2 \sum_{j\neq i} \frac{1}{(x_i - x_j)^2}$$

$$V(z) \simeq \frac{1}{z^2} \qquad \wp(x_j - x_i)$$

The **Calogero-Moser (CM)** system has several generalizations

rCM —> tCM —> eCM

$$V(z) \simeq \frac{1}{\sinh z^2}$$



Another relativistic generalization called **Ruijsenaars-Schneider (RS)** family

rRS —> tRS —> eRS

Geometrically described by Hamiltonian reduction of T*GL(n)

$$H_{CM} = \lim_{c\to\infty} H_{RS} - nmc^2$$

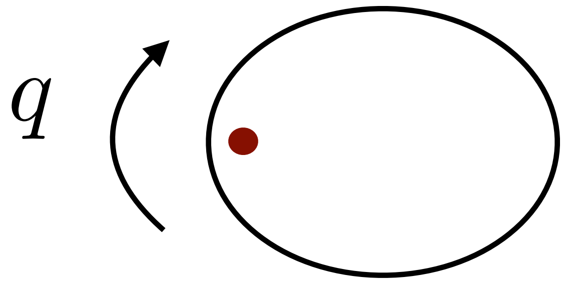
XXZ/tRS duality! Can we generalize it?

II. q-Opers — SL(2) Example

Consider vector bundle E over $\mathbb{P}^1$

$$M_q : \mathbb{P}^1 \to \mathbb{P}^1$$
$$z \mapsto qz$$



Map of vector bundles $A : E \longrightarrow E^q$

Upon trivialization $A(z) \in \mathfrak{gl}(N, \mathbb{C}(z))$

q-gauge transformation $A(z) \mapsto g(qz)A(z)g^{-1}(z)$

Difference equation $D_q(s) = As$

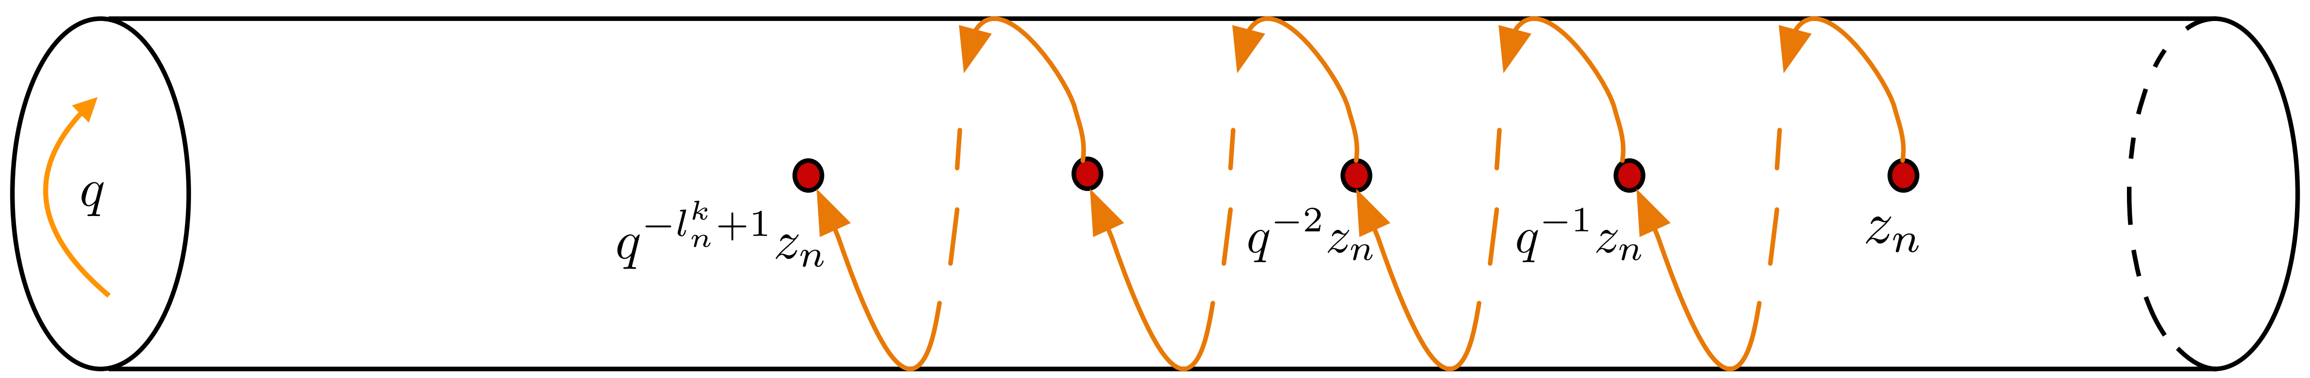
Definition: A meromorphic $(\mathrm{GL}(N), q)$-*connection* over $\mathbb{P}^1$ is a pair (E, A), where E is a (trivializable) vector bundle of rank N over $\mathbb{P}^1$ and A is a meromorphic section of the sheaf $\mathrm{Hom}_{\mathcal{O}_{\mathbb{P}^1}}(E, E^q)$ for which $A(z)$ is invertible, i.e. lies in $\mathrm{GL}(N, \mathbb{C}(z))$. The pair (E, A) is called an $(\mathrm{SL}(N), q)$-connection if there exists a trivialization for which $A(z)$ has determinant 1.

q-Opers

Definition: A $(\mathrm{GL}(2), q)$-*oper* on $\mathbb{P}^1$ is a triple $(E, A, \mathcal{L})$, where (E, A) is a $(\mathrm{GL}(2), q)$-connection and $\mathcal{L}$ is a line subbundle such that the induced map $\bar{A} : \mathcal{L} \longrightarrow (E/\mathcal{L})^q$ is an isomorphism. The triple is called an $(\mathrm{SL}(2), q)$-*oper* if (E, A) is an $(\mathrm{SL}(2), q)$-connection.

in a trivialization $s(qz) \wedge A(z)s(z) \neq 0$

Definition: A $(\mathrm{SL}(2), q)$-*oper with regular singularities* at the points $z_1, \ldots, z_L \neq 0, \infty$ with weights $k_1, \ldots k_L$ is a meromorphic $(\mathrm{SL}(2), q)$-oper $(E, A, \mathcal{L})$ for which $\bar{A}$ is an isomorphism everywhere on $\mathbb{P}^1 \setminus \{0, \infty\}$ except at the points z_m, $q^{-1}z_m$, $q^{-2}z_m$, $\ldots$, $q^{-k_m+1}z_m$ for $m \in \{1, \ldots, L\}$, where it has simple zeros.



Finally, (SL(2),q)-oper is ***Z-twisted*** in A(z) is gauge equivalent to a diagonal matrix Z

Miura q-Opers

Miura (SL(2),q)-oper is a quadruple $(E, A, \mathcal{L}, \hat{\mathcal{L}})$ where $(E, A, \mathcal{L})$ is an (SL(2),q)-oper and $\hat{\mathcal{L}}$ is preserved by the q-connection *A*

Chose trivialization of $\mathcal{L}$

$$s(z) = \begin{pmatrix} Q_+(z) \\ Q_-(z) \end{pmatrix}$$

Twist element $Z = \mathrm{diag}(\zeta, \zeta^{-1})$

q-Oper condition — SL(2) **QQ-system**

$$\zeta Q_-(z) Q_+(zq) - \zeta^{-1} Q_-(zq) Q_+(z) = \Lambda(z)$$

singularities

$$\Lambda(z) = \prod_{p=1}^{L} \prod_{j_p=0}^{r_p-1} (z - q^{-j_p} z_p)$$

One of the polynomials can be made monic

$$Q_+(z) = \prod_{k=1}^{m} (z - w_k)$$

From QQ-system to Bethe equations

$$\frac{\Lambda(w_k)}{\Lambda(q^{-1}w_k)} = -\zeta^2 \frac{Q_+(qw_k)}{Q_+(q^{-1}w_k)}, \qquad k = 1, \ldots, m.$$

$$q^r \prod_{p=1}^{L} \frac{w_k - q^{1-r_p} z_p}{w_k - q z_p} = -\zeta^2 q^m \prod_{j=1}^{m} \frac{q w_k - w_j}{w_k - q w_j}, \qquad k = 1, \ldots, m$$

q-Miura Transformation

$$A(z) = \begin{pmatrix} g(z) & \Lambda(z) \\ 0 & g(z)^{-1} \end{pmatrix}$$

Z-twisted q-oper condition $A(z) = v(zq)Zv(z)^{-1}, \qquad Z = \begin{pmatrix} \zeta & 0 \\ 0 & \zeta^{-1} \end{pmatrix}$

Gauge transformation reads

$$v(z) = \begin{pmatrix} y(z) & 0 \\ 0 & y(z)^{-1} \end{pmatrix} \begin{pmatrix} 1 & -\frac{Q_-(z)}{Q_+(z)} \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} y(z) & -y(z)\frac{Q_-(z)}{Q_+(z)} \\ 0 & y(z)^{-1} \end{pmatrix}$$

We find

$$g(z) = \zeta_i y(zq) y(z)^{-1}$$

$$\Lambda(z) = y(z)y(zq)\left(\zeta\frac{Q_-(z)}{Q_+(z)} - \zeta^{-1}\frac{Q_-(zq)}{Q_+(zq)}\right)$$

The q-oper condition becomes the **SL(2) QQ-system**

$$\zeta Q_-(z)Q_+(zq) - \zeta^{-1}Q_-(zq)Q_+(z) = \Lambda(z)$$

Difference Equation $D_q(s) = As.$ $\qquad D_q(s_1) = \Lambda(z)s_2$

after elimination

$$\left(D_q^2 - T(qz)D_q - \frac{\Lambda(qz)}{\Lambda(z)}\right)s_1 = 0$$

tRS Hamiltonians

Recover 2-body tRS Hamiltonian from a q-Oper

Let $Q_- = z - p_-$ and $Q_+ = c(z - p_+)$

$$z^2 - \frac{z}{q}\left[\frac{\zeta - q\zeta^{-1}}{\zeta - \zeta^{-1}} p_+ + \frac{q\zeta - \zeta^{-1}}{\zeta - \zeta^{-1}} p_-\right] + \frac{p_+ p_-}{q} = (z - z_+)(z - z_-)$$

T_1 T_2

qOper condition yields tRS Hamiltonians!

$$\det(z - L_{tRS}) = (z - z_+)(z - z_-)$$

III. (G,q)-Connection

G-simple simply-connected complex Lie group

Principal G-bundle $\mathcal{F}_G$ over $\mathbb{P}^1$

$$M_q : \mathbb{P}^1 \to \mathbb{P}^1$$
$$z \mapsto qz$$

A meromorphic **(G,q)-connection** on $\mathcal{F}_G$ is a section A of $\mathrm{Hom}_{\mathcal{O}_U}(\mathcal{F}_G, \mathcal{F}_G^q)$ U-Zariski open dense set

Choose U so that the restriction $\mathcal{F}_G|_U$ of $\mathcal{F}_G$ to U is isomorphic to a trivial G-bundle

$A(z) \in G(\mathbb{C}(z))$ on $U \cap M_q^{-1}(U)$

Change of trivialization $A(z) \mapsto g(qz)A(z)g(z)^{-1}$

(G,q)-Opers

A meromorphic (G,q)-oper on $\mathbb{P}^1$ is a triple $(\mathcal{F}_G, A, \mathcal{F}_{B_-})$

A is a meromorphic (G,q)-connection

$\mathcal{F}_{B_-}$ is a reduction of $\mathcal{F}_G$ to B_-

Oper condition: Restriction of the connection on some Zariski open dense set U

$$A : \mathcal{F}_G \longrightarrow \mathcal{F}_G^q \text{ to } U \cap M_q^{-1}(U)$$

takes values in the *double Bruhat cell*

$$B_-(\mathbb{C}[U \cap M_q^{-1}(U)])cB_-(\mathbb{C}[U \cap M_q^{-1}(U)])$$

Coxeter element: $c = \prod_i s_i$

Locally

$$A(z) = n'(z)\prod_i(\phi_i(z)^{\check{\alpha}_i}\, s_i)n(z)$$

$\phi_i(z) \in \mathbb{C}(z)$ and $n(z), n'(z) \in N_-(z)$

Miura (G,q)-Opers

Definition: A *Miura* (G,q)-*oper* on $\mathbb{P}^1$ is a quadruple $(\mathcal{F}_G, A, \mathcal{F}_{B_-}, \mathcal{F}_{B_+})$, where $(\mathcal{F}_G, A, \mathcal{F}_{B_-})$ is a meromorphic (G,q)-oper on $\mathbb{P}^1$ and $\mathcal{F}_{B_+}$ is a reduction of the G-bundle $\mathcal{F}_G$ to B_+ that is preserved by the q-connection A.

It can be shown that the two flags $\mathcal{F}_{B_-}$ and $\mathcal{F}_{B_+}$ are in *generic relative position* for some dense set V

The fiber $\mathcal{F}_{G,x}$ of $\mathcal{F}_G$ at x is a G-torsor with reductions $\mathcal{F}_{B_-,x}$ and $\mathcal{F}_{B_+,x}$ to B_- and B_+, respectively. Choose any trivialization of $\mathcal{F}_{G,x}$, i.e. an isomorphism of G-torsors $\mathcal{F}_{G,x} \simeq G$. Under this isomorphism, $\mathcal{F}_{B_-,x}$ gets identified with $aB_- \subset G$ and $\mathcal{F}_{B_+,x}$ with bB_+.

Then $a^{-1}b$ is a well-defined element of the double quotient $B_-\backslash G/B_+$, which is in bijection with W_G.

We will say that $\mathcal{F}_{B_-}$ and $\mathcal{F}_{B_+}$ have a generic relative position at $x \in X$ if the element of W_G assigned to them at x is equal to 1 (this means that the corresponding element $a^{-1}b$ belongs to the open dense Bruhat cell $B_- \cdot B_+ \subset G$).

Structure Theorems

Theorem 1: *For any Miura (G, q)-oper on $\mathbb{P}^1$, there exists a trivialization of the underlying G-bundle $\mathcal{F}_G$ on an open dense subset of $\mathbb{P}^1$ for which the oper q-connection has the form*

$$A(z) \in N_-(z) \prod_i ((\phi_i(z)^{\check{\alpha}_i} s_i) N_-(z) \ \cap \ B_+(z).$$

Theorem 2: *Let F be any field, and fix $\lambda_i \in F^\times, i = 1, \ldots, r$. Then every element of the set $N_- \prod_i \lambda_i^{\check{\alpha}_i} s_i N_- \ \cap \ B_+$ can be written in the form*

$$\prod_i g_i^{\check{\alpha}_i} e^{\frac{\lambda_i t_i}{g_i} e_i}, \qquad g_i \in F^\times,$$

where each $t_i \in F^\times$ is determined by the lifting s_i.

Adding Singularities and Twists

Consider family of polynomials $\{\Lambda_i(z)\}_{i=1,\dots,r}$

(G,q)-oper with regular singularities can be written as

$$A(z) = n'(z)\prod_i(\Lambda_i(z)^{\check{\alpha}_i}\, s_i)n(z), \qquad n(z), n'(z) \in N_-(z)$$

Using structure theorem every Miura (G,q)-oper with singularities reads

$$A(z) = \prod_i g_i(z)^{\check{\alpha}_i}\; e^{\frac{\Lambda_i(z)}{g_i(z)}e_i}, \qquad g_i(z) \in \mathbb{C}(z)^\times$$

(G,q)-oper is **Z-twisted** if it is equivalent to a constant element of G $\quad Z \in H \subset H(z)$ Z is regular semisimple. There are W_G Miura (G,q)-opers for each (G,q)-opers

$$A(z) = g(qz)Zg(z)^{-1}$$

Z-twisted Miura (G,q)-oper if gauge transform is from Borel

$$A(z) = v(qz)Zv(z)^{-1}, \qquad v(z) \in B_+(z)$$

Plucker Relations

V_i^+ irrep of G with highest weight ω_i Line $L_i \subset V_i$ stable under B_+

Plucker relations: for two integral dominant weights $L_{\lambda+\mu} \subset V_{\lambda+\mu}$ is the image of $L_\lambda \otimes L_\mu \subset V_\lambda \otimes V_\mu$

under canonical projection $V_\lambda \otimes V_\mu \longrightarrow V_{\lambda+\mu}$

Conversely, for a collection of lines $L_\lambda \subset V_\lambda$ satisfying Plucker relations $\exists B \subset G$ such that L_λ is stabilized by B for all λ

A choice of B is equivalent to a choice of B_+-torsor in G

Let ν_{ω_i} be a generator of the line $L_i \subset V_i$. This is a vector of weight ω_i wrt $H \subset B_+$

The subspace of V_i of weight $\omega_i - \alpha_i$ is one-dimensional and spanned by $f_i \cdot \nu_{\omega_i}$

Thus the 2d subspace spanned by $\{\nu_{\omega_i}, f_i \cdot \nu_{\omega_i}\}$ is a B_+-invariant subspace of V_i

Miura-Plucker (G,q)-Opers

let $(\mathcal{F}_G, A, \mathcal{F}_{B_-}, \mathcal{F}_{B_+})$ be a Miura (G,q)-oper with regular singularities $\{\Lambda_i(z)\}_{i=1,\dots,r}$

Associated vector bundle $\mathcal{V}_i = \mathcal{F}_{B_+} \underset{B_+}{\times} V_i = \mathcal{F}_G \underset{G}{\times} V_i$ contains rank-two subbundle $\mathcal{W}_i = \mathcal{F}_{B_+} \underset{B_+}{\times} W_i$

associated to $W_i \subset V_i$, and $\mathcal{W}_i$ in turn contains a line subbundle $\mathcal{L}_i = \mathcal{F}_{B_+} \underset{B_+}{\times} L_i$

Using structure theorems we obtain **r** Miura (GL(2),q)-opers

$$A_i(z) = \begin{pmatrix} g_i(z) & \Lambda_i(z) \prod_{j>i} g_j(z)^{-a_{ji}} \\ 0 & g_i^{-1}(z) \prod_{j\neq i} g_j(z)^{-a_{ji}} \end{pmatrix}$$

Z-twisted Miura-Plucker (G,q)-oper is meromorphic Miura (G,q)-oper on P1 such that for each Miura (GL(2),q)-oper

$$A_i(z) = v(zq) Z v(z)^{-1}|_{W_i} = v_i(zq) Z_i v_i(z)^{-1}$$

where $v_i(z) = v(z)|_{W_i}$ and $Z_i = Z|_{W_i}$

QQ-System

Theorem: *There is a one-to-one correspondence between the set of nondegenerate Z-twisted Miura-Plücker (G,q)-opers and the set of nondegenerate polynomial solutions of the QQ-system*

$$\widetilde{\xi}_i Q^i_-(z) Q^i_+(qz) - \xi_i Q^i_-(qz) Q^i_+(z) = \Lambda_i(z) \prod_{j>i} \left[Q^j_+(qz) \right]^{-a_{ji}} \prod_{j<i} \left[Q^j_+(z) \right]^{-a_{ji}}, \qquad i = 1, \dots, r,$$

$$\widetilde{\xi}_i = \zeta_i \prod_{j>i} \zeta_j^{a_{ji}}, \qquad \xi_i = \zeta_i^{-1} \prod_{j<i} \zeta_j^{-a_{ji}}$$

Proof uses

$$v(z) = \prod_{i=1}^{r} y_i(z)^{\check{\alpha}_i} \prod_{i=1}^{r} e^{-\frac{Q^i_-(z)}{Q^i_+(z)} e_i} \dots,$$

$$g_i(z) = \zeta_i \frac{Q^i_+(qz)}{Q^i_+(z)}$$

XXZ Bethe Ansatz Equations for G

roots of Q+

$$\frac{Q^i_+(q w^k_i)}{Q^i_+(q^{-1} w^k_i)} \prod_j \zeta_j^{a_{ji}} = - \frac{\Lambda_i(w^i_k)\prod_{j>i}\left[Q^j_+(q w^i_k)\right]^{-a_{ji}} \prod_{j<i}\left[Q^j_+(w^i_k)\right]^{-a_{ji}}}{\Lambda_i(q^{-1}w^i_k)\prod_{j>i}\left[Q^j_+(w^i_k)\right]^{-a_{ji}}\prod_{j<i}\left[Q^j_+(q^{-1}w^i_k)\right]^{-a_{ji}}}$$

Nondegenerate ***Z-twisted Miura*** (G,q)-opers with regular singularities

Quantum Backlund Transformation

Theorem: Consider the following q-gauge transformation

$$A \mapsto A^{(i)} = e^{\mu_i(qz) f_i} A(z) e^{-\mu_i(z) f_i}, \quad \text{where} \quad \mu_i(z) = \frac{\prod_{j \neq i} \left[Q_+^j(z) \right]^{-a_{ji}}}{Q_+^i(z) Q_-^i(z)}$$

changes the set of Q-functions

$$Q_+^j(z) \mapsto Q_+^j(z), \qquad j \neq i,$$
$$Q_+^i(z) \mapsto Q_-^i(z), \qquad Z \mapsto s_i(Z)$$

$$\{\widetilde{Q}_+^j\}_{j=1,\dots,r} = \{Q_+^1, \dots, Q_+^{i-1}, Q_-^i, Q_+^{i+1} \dots, Q_+^r\}$$
$$\{\widetilde{z}_j\}_{j=1,\dots,r} = \{z_1, \dots, z_{i-1}, z_i^{-1} \prod_{j \neq i} z_j^{-a_{ji}}, \dots, z_r\}$$

Now the strategy is to successively apply Backlund transformations according to the reduced decomposition of the element of the Weyl group

Consider longest element $\quad w_0 = s_{i_1} \dots s_{i_\ell}$

Theorem: Every Z-twisted Miura-Plucker (G,q)-oper is Z-twisted Miura (G,q)-oper

The proof based on properties of double Bruhat cells addresses existence of the diagonalizing element v(z) (to be constructed later)

(SL(N),q)-Opers

The QQ-system
$$\xi_i \phi_i(z) - \xi_{i+1}\phi_i(qz) = \rho_i(z)$$

$$\phi_i(z) = \frac{Q_i^-(z)}{Q_i^+(z)}\,, \qquad \rho_i(z) = \Lambda_i(z)\frac{Q_{i-1}^+(qz)Q_{i+1}^+(z)}{Q_i^+(z)Q_i^+(qz)}$$

q-Oper condition
$$v(qz)^{-1}A(z) = Zv(z)^{-1}$$

Diagonalizing element

Polynomials $Q^-_{i,\dots,j}(z)$

form extended QQ-system

$$v(z)^{-1} = \begin{pmatrix} \frac{1}{Q_1^+(z)} & \frac{Q_1^-(z)}{Q_2^+(z)} & \frac{Q_{12}^-(z)}{Q_3^+(z)} & \dots & \frac{Q^-_{1,\dots,r-1}(z)}{Q_r^+(z)} & Q^-_{1,\dots,r}(z) \\ 0 & \frac{Q_1^+(z)}{Q_2^+(z)} & \frac{Q_2^-(z)}{Q_3^+(z)} & \dots & \frac{Q^-_{2,\dots,r-1}(z)}{Q_r^+(z)} & Q^-_{2,\dots,r}(z) \\ 0 & 0 & \frac{Q_2^+(z)}{Q_3^+(z)} & \dots & \frac{Q^-_{3,\dots,r-1}(z)}{Q_r^+(z)} & Q^-_{3,\dots,r}(z) \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & \dots & \dots & \dots & \frac{Q^+_{r-1}(z)}{Q_r^+(z)} & Q_r^-(z) \\ 0 & \dots & \dots & \dots & 0 & Q_r^+(z) \end{pmatrix}$$
