## Quiz

## DIS 203 and 210

## March 12th

1. Write down $e^{0.001}$ correct to seven places after the decimal. Hints. ${ }^{1}$
2. Write down the general solution of

$$
\left(1+2 x^{2}+x^{4}\right) f^{\prime}(x)+\left(2 x+2 x^{3}\right) f(x)=1 .
$$

Hints. ${ }^{2}$
3. Write down a power series

$$
f(x)=\sum_{k=0}^{\infty} c_{k} x^{k}
$$

that solves the differential equation $f^{\prime \prime \prime}(x)=f(x), f(0)=1, f^{\prime}(0)=0, f^{\prime \prime}(0)=0$, and convince me that your solution is correct. Hints. ${ }_{-}^{3}$

Write your name and your answers below, or on the back of this page.

[^0]
[^0]:    ${ }^{1}$ Use the first three terms of the Maclaurin series for $\exp (x)$.
    ${ }^{2}$ Convert to a linear equation. It might help to factor $\left(1+2 x^{2}+x^{4}\right)$ and $\left(2 x+2 x^{3}\right)$.
    ${ }^{3}$ If you look at successive derivatives of $f$, they repeat. You can figure out from the given information what $f^{(n)}(0)$ is for any $n$, and therefore write down the Maclaurin series. This tells you what the answer is, but logically speaking it doesn't tell you why the answer is correct, so be careful!
